Dear Mr. Villanueva:

In accordance with Caltrans Contract No. 43A0078 and Task Order No. 07-3N5101-PN dated March 20, 2002, Geocon Consultants, Inc. has performed an aerially deposited lead (ADL) investigation at the site consisting of the exposed soil up to 2.4 meters from the edge of the traveled way along the northwest corner of Redondo Avenue and 29th Street in Long Beach, California. The accompanying report summarizes the services performed, including the advancement of hand-auger borings, limited soil sampling, laboratory analyses, statistical analyses, and Geographical Information System (GIS) Surveying. Please call us if you have any questions.

Sincerely,

GEOCON CONSULTANTS, INC.

Mike Conkle

I. EXECUTIVE SUMMARY

Geocon Consultants, Inc. (Geocon) has performed aerially deposited lead (ADL) investigation at the site consisting of the exposed soil up to 2.4 meters (m) from the edge of the traveled way along the northwest corner of Redondo Avenue and 29th Street in Long Beach, California. The California Department of Transportation (Caltrans) proposes to excavate soil at the site for curb ramps and sidewalk access to comply with the American with Disability Act.

The investigation was performed to evaluate the presence of lead resulting from the historical combustion of leaded fuels from freeway traffic. Data from the investigation was used to evaluate the potential reuse or disposal considerations for soil excavated at the site, and to inform Caltrans of potential health and safety issues concerning the presence of lead in soil for workers at the site during construction activities.

Soil samples collected from the site were subsequently analyzed for total lead, soil pH, soluble lead using the Waste Extraction Test (WET) method using citric acid as the extractant, and soluble lead using a modified WET method using deionized water (WET-DI) as the extractant. In addition, selected soil samples were analyzed for soluble lead using the Toxicity Characteristic Leaching Procedure (TCLP) method, California Code of Regulations (CCR) Title 22 metals, and soil pH.

Laboratory analytical results and statistical analysis using 90% upper one-sided confidence limits (UCLs) were compared to the guidelines of the Department of Toxic Substances Control (DTSC) Lead Variance issued to Caltrans and Assembly Bill 414 to develop recommendations for reuse of soil from the site. Offsite disposal conclusions were based upon comparison of 95% UCLs and predicted WET-Citric results to CCR Title 22 and California Health and Safety Code (HSC) criteria. These conclusions are presented below:

Based upon the 90% arcsine transformed UCLs and average WET-DI results, the upper 0.6 m of soil is suitable for re-use within the Caltrans rights-of-way. The soil should be placed under at least 0.3m of non-hazardous fill or pavement and at least 1.5 m above maximum groundwater in accordance with the DTSC variance.

Based upon the 95% arcsine transformed UCLs and predicted WET-Citric results, if the upper 0.15 m of soil excavated from the site is to be disposed, it should be handled as a hazardous material with respect to soluble lead content. The underlying soil from 0.15 m to 0.60 m should be handled as a non-hazardous material with respect to lead content. If the entire soil column to a depth of 0.60 m is to be disposed as a single unit, it should be handled as a non-hazardous material with respect to total and soluble lead.

Other CCR Title 22 metals do not appear to be a concern; however, additional sampling and statistical analyses would be necessary to fully characterize this soil. Caltrans should notify the contractors performing the construction activities that hazardous concentrations of lead may be present in onsite soil and that appropriate health and safety measures should be taken to minimize the exposure to lead.

AERIALY DEPOSITED LEAD INVESTIGATION REPORT

1. INTRODUCTION

1.1 Project Description and Objectives

Geocon has conducted an ADL investigation at the site consisting of the exposed soil up to 2.4 meters (m) from the edge of the traveled way along the northwest corner of Redondo Avenue and 29th Street in Long Beach, California (Figure 1).

The objective of the ADL investigation was to evaluate soil at the site for the presence of lead resulting from the historical combustion of leaded fuels from freeway traffic. The information obtained from the limited soil sampling and laboratory testing was used to evaluate the method of reuse or disposal of soil excavated during the proposed construction activities at the site. The data was also used to inform Caltrans of potential health and safety issues for workers at the site during construction activities.

1.2 Scope of Work

Geocon performed the following tasks:

1.2.1 Pre-field Activities

- Attended a Task Order meeting on April 24, 2002 to discuss issues such as field methods, boring locations, health and safety measures, and the completion schedule.
- Prepared a Health and Safety Plan (HSP) dated April 23, 2002, for the proposed activities. The Health and Safety Plan included guidelines for the use of personal protective equipment for Geocon employees during the field activities. The HSP specifies the safety procedures for work to be performed at the site, chemical hazard information, site safety officers, and medical emergency locations. The HSP was prepared as required by Contract 43A0078 in general accordance with 29 CFR 1910.120 and CCR Title 8.
- Contacted Underground Service Alert (USA) to notify utility companies of the field activities.

1.2.2 Limited Soil Sampling

A 7.62-centimeter-diameter hand auger was used to collect 38 soil samples from 13 boring locations from the northwest corner of Redondo Avenue and 29th Street on April 26, 2002. Sample B8-0.6 was not collected due to cobbles within the borehole. Boring locations were provided by Caltrans as specified on Page 4 of Task Order No. 07-3N5101-PN, dated March 20, 2002, for the evaluation of the

subsurface condition at the site. The borings were advanced to a maximum depth of 0.6 m below the ground surface, and soil samples were collected at 0.15 m, 0.3 m, and 0.6 m. The approximate boring locations are shown on the Boring Location Map, Figure 2. The borings were subsequently backfilled with the soil cuttings generated.

1.2.3 Laboratory Analyses

Geocon submitted the soil and water samples under chain of custody procedures to Advanced Technology Laboratories (ATL) a California Department of Health Services (CDOHS)-certified analytical laboratory. All soil samples were analyzed for total lead following United States Environmental Protection Agency (EPA) Test Method 6010B. Soil samples exhibiting total lead concentrations greater than or equal to 50 milligrams per kilograms (mg/kg) and less than 1,000 mg/kg were analyzed for soluble lead following EPA Test Method 7420 using the WET-Citric method. One sample exhibiting WET-Citric concentrations greater than 5 milligrams per liter (mg/l) was analyzed for soluble lead following EPA Test Method 7420 using the WET-DI method. The four samples with the highest total lead concentrations were analyzed using the TCLP method. The two samples containing the highest total lead concentration were also analyzed for the CCR Title 22 metals by EPA Methods 6010B and 7471A. In addition, four of the soil samples were analyzed for pH following EPA Test Method 9045.

Equipment blank samples were analyzed for total lead using EPA Test Method 6010B.

Decontamination water was analyzed for the CCR Title 22 metals by EPA Methods 6010B and 7471A.

1.2.4 GIS Surveying

Each boring location was recorded using a Global Positioning System (GPS) receiver. Data was recorded using the Axis III™ receiver system, using State Plane 83 coordinates, with the IMAP™ software package. Boring location coordinates, in latitude and longitude, are provided in Appendix A.

1.2.5 Report Preparation

This report was prepared as outlined in Contract No. 43A0078 and in Task Order No. 07-3N5101-PN, summarizing the results of the aerially deposited lead investigation activities requested by Caltrans.

1.3 Previous Site Investigations

Geocon has not performed a previous investigation at the site. In addition, Caltrans has not notified Geocon of previous investigations performed at the site.

2. BACKGROUND

2.1 Aerially Deposited Lead in Soil

Testing by Caltrans throughout the State has shown that aerially deposited lead exists in soil along major freeway routes resulting from automobile exhaust containing lead from the combustion of leaded gasoline. Elevated lead concentrations are generally found within 9.1 m of the edge of pavement and within the top 0.15 m of soil. Elevated lead concentrations can also be present as deep as 0.6 to 0.9 m below the surface. The concentration and distribution of aerially deposited lead in soil is dependent on many variables, but in general, traffic volume and age of a highway are the primary factors.

2.2 Hazardous Waste Classification Criteria

Regulatory criteria to classify a waste as "California hazardous" for handling and disposal purposes are contained in the CCR, Title 22, Division 4.5, Chapter 11, Article 3, §66261.24. Criteria to classify a waste as "Resource, Conservation, and Recovery Act (RCRA) hazardous" are contained in Chapter 40 of the *Code of Federal Regulations* (40 CFR), §261.

For a waste containing metals, the waste is classified as "California hazardous" when: (1) the total metal content exceeds the Total Threshold Limit Concentration (TTLC); or (2) the soluble metal content exceeds the Soluble Threshold Limit Concentration (STLC) based on a Waste Extraction Test (WET) analysis. A material is classified as "RCRA hazardous" when the soluble metal content exceeds the Federal Regulatory Level based on Toxicity Characteristic Leaching Procedure (TCLP) testing.

The above regulatory criteria are based on toxicity. Wastes may also be classified as hazardous based on other criteria including ignitability, toxicity, corrosivity, and reactivity. However, for the purposes of ADL investigations, toxicity and corrosivity (i.e., chemical concentrations and soil pH values, respectively) are the primary factors considered for waste classification. Waste that is classified as either "California hazardous" or "RCRA hazardous" requires management as a hazardous waste and disposal at an approved disposal facility.

According to §25157.8 of the HSC, after January 1, 1999, no person shall dispose of waste that contains total lead in excess of 350 mg/kg to land other than a Class I hazardous waste disposal facility.

2.3 DTSC Variance

The DTSC issued a variance to selected Caltrans Districts on September 22, 2000, to provide guidance for the disposition of soil containing ADL within Caltrans projects. The California State Assembly passed Assembly Bill (AB) 414 dated October 14, 2001 which allows Caltrans to reuse lead impacted soil with their rights-of-way provided that total lead concentrations do not exceed 1,496 mg/kg. Review of the variance and AB 414 indicates the following conditions regarding Caltrans' reuse and management of ADL impacted soil as fill material for construction and maintenance operations.

2.3.1 Condition 1

Soil exhibiting soluble lead concentrations less than or equal to 0.5 mg/l (WET-DI) and total lead concentrations of 1,496 mg/kg or less may be used as fill provided that the soil containing ADL is placed a minimum of 1.5 m above the maximum water table elevation and covered with at least 0.3 m of clean soil.

2.3.2 Condition 2

Soil exhibiting soluble lead concentrations greater than 0.5 mg/l (WET-DI) and total lead concentrations of 1,496 mg/kg or less may be used as fill provided that the soil containing ADL is placed a minimum of 1.5 m above the maximum water table elevation and protected from infiltration by a pavement structure maintained by Caltrans.

2.3.3 Condition 3

Contaminated soil with a pH less than 5.0 may be used as fill material only under the paved portion of the roadway. Condition 3 prevails under either Condition 1 or 2.

2.4 Criteria For Disposal Of Soil Not Intended For Reuse Onsite

If the excavated soil is not intended to be reused within the Caltrans right-of-way, then hazardous waste determination of the soil is based on total and soluble lead concentrations using the lead TTLC and STLC contained in Title 22 of the CCR Article 3, §66261.24. When the total lead concentration is greater than ten times the lead STLC, regulatory agencies typically initiate the requirement for WET

using citric acid. It is the result from the WET that is compared to the STLC value. The TTLC value for lead is 1,000 mg/kg and the STLC for lead using acid extract is 5.0 mg/l. However, as previously indicated, disposal of waste that contains total lead in excess of 350 mg/kg to land other than a Class I hazardous waste disposal facility (or other designated facility meeting all the criteria in HSC 25157.8(3)(b)) is prohibited.

3. INVESTIGATIVE METHODS

3.1 Field Methods

3.1.1 Soil Sampling

Soil sampling and handling methods used by Geocon to complete this Task Order are outlined in the following modified Geocon Standard Operating Procedures (SOPs) presented as Appendix B:

- Modified SOP No. 11 - Hand-Augering and Soil Sample Collection/Handling Procedures

3.1.2 Equipment Blank Sampling

One equipment blank sample was collected after every per chain-of-custody (every ten soil samples) to verify proper cleaning of the sampling equipment. The equipment blank samples were obtained by passing distilled water over the decontaminated sampling equipment and into laboratory-provided containers. The equipment blank results for this project, labeled C-5 through C-8 are provided in Appendix C. The laboratory report containing the equipment blank results also contains results for equipment blanks labeled C-1 through C-4 which were collected as part of another project. These equipment blanks are discussed in a separate report.

3.1.3 Decontamination Water Sample Analysis

All liquids resulting from cleaning of sampling equipment were placed in a sealed 55 gallon drum and stored at a Caltrans maintenance station. One water sample (labeled "DRUM") was collected at the conclusion of the field activities and was analyzed for CCR Title 22 metals. Based on these results, the drum of decontamination water was determined to be non-hazardous and emptied on site. Care was taken to prevent the liquids from entering storm drains.

3.2 Deviations from Work Plan

A work plan was not prepared for this Task Order; however, Geocon performed the scope of work as described in the Task Order.

4. INVESTIGATIVE RESULTS AND FIELD OBSERVATIONS

4.1 Site Geology and Hydrology

The soil conditions encountered consisted generally of dry, light brown to brown, silt and sand. Groundwater was not encountered in the hand auger borings.

4.2 Analytical Laboratory Results

A summary of the results of the laboratory analyses for total lead, WET-Citric, WET-DI, TCLP, and pH is presented in Table I. A summary of the results of the laboratory analyses for CCR Title 22 metals is presented in Table II. Reproductions of the laboratory reports and chain-of-custody documentation are presented as Appendix C. Samples were processed using laboratory 5 business day turn around times.

Soil sample analytical results are summarized as follows (see Section 1.2.3 for analytical methods used):

- **Total Lead** - Thirty eight soil samples were analyzed for total lead. Concentrations ranged from below the laboratory reporting limit of 5 mg/kg to 240 mg/kg. The maximum total lead concentration for this data set does not exceed either the 350 mg/kg threshold value specified in HSC or the 1,496 mg/kg, the threshold value specified in the DTSC variance for total lead. The average of the total data set is 53.6 mg/kg;
- **WET-Citric** - Fourteen soil samples exhibited total lead concentrations greater than 50 mg/kg and less than 1,000 mg/kg, and were analyzed using the WET-Citric method. WET-Citric concentrations ranged from 2 mg/l to 21 mg/l. CCR Title 22 specifies 5.0 mg/l as the STLC for lead;
- **WET-DI** - Seven soil samples exhibited total lead concentrations less than 350 mg/kg and WET-Citric concentrations greater than the STLC of 5.0 mg/l, and were analyzed using the WET-DI method. The WET-DI concentrations were all below the laboratory reporting limit of 0.2 mg/l. The DTSC variance specifies conditions for re-use of soil based on a threshold of 0.5 mg/l as described in Section 2.3;
- **pH** - Four soil samples were tested for pH. Values ranged from 8.15 to 8.69, which are above the minimum of 5.0 described in the DTSC variance;
- **TCLP** - Four soil samples were analyzed by the TCLP method. Their concentrations ranged from 0.27 mg/l to 0.30 mg/l. None of the results were above 5.0 mg/l, the TCLP for RCRA waste for lead;
- **CCR Title 22 Metals** - Two soil samples were analyzed for CCR Title 22 metals. Metals included in this analysis are antimony, arsenic, barium, beryllium, cadmium, chromium, cobalt, copper, lead, mercury, molybdenum, nickel, selenium, silver, thallium, vanadium, and

zinc. None of the metals concentrations were detected at or above the respective TTLC. Lead was the only analyte detected above ten times the respective STLCs;

- **Equipment Blanks** - Four equipment blank water samples were analyzed for total lead. All samples were not reported at the laboratory detection limit of 0.005 mg/l; and
- **Decontamination Water** - The decontamination water was analyzed for the metals antimony, arsenic, barium, beryllium, cadmium, chromium, cobalt, copper, lead, mercury, molybdenum, nickel, selenium, silver, thallium, vanadium, and zinc. Copper and selenium, at concentrations of 0.0046 mg/l and 0.0091 mg/l, respectively, were the only metals detected. These results are below the STLC of 25 mg/l for copper and 1 mg/l for selenium.

4.3 Data Validation

Geocon and ATL use QA/QC measures to minimize and control errors associated with field and laboratory methods. Field QA/QC measures consist of cleaning sampling equipment between each use with a detergent solution followed by successive rinses in tap and deionized water. To demonstrate that cleaning of the equipment was adequate, equipment blanks are collected by passing deionized water through the hand auger and collecting it in a laboratory provided container. One equipment blank was collected for each chain of custody used. Laboratory results indicated that all equipment blanks were non-detect at the laboratory reporting limit of 0.005 mg/l. Based on these results, Geocon considers the field investigation free from potential influence from cross-contamination from inadequate equipment decontamination.

Laboratory QA/QC measures include the use of matrix spikes, duplicates, and method blanks, and calculation of percent recovery and relative percentage difference (RPD). A review of the laboratory QA/QC results indicate satisfactory data reporting.

5. DATA EVALUATION

5.1 Lead Distribution Analysis

The results of the analytical testing indicates that all of the samples collected for this investigation exhibited total lead concentrations below the HSC limit of 350 mg/kg. However, soluble lead concentrations meet or exceeded the STLC threshold in 7 of the 14 of the samples analyzed. Soluble lead concentrations exceeded the STLC threshold limit at the 0.15 and 0.3 m depth intervals. None of the samples exceeded the TCLP threshold of 5 mg/l.

5.2 Statistical Evaluation Methods

The analytical laboratory results were evaluated statistically to examine the appropriate method of reuse or offsite disposal of the soils. Prior to performing the following calculations, analytical results reported as below the detection limit were assigned a value of one-half the detection limit. Statistical methods were applied to the lead data set collected adjacent to the site to evaluate: 1) if an acceptable correlation between total and soluble lead concentrations exists that would allow the prediction of soluble lead concentrations based on calculated UCLs; 2) the total lead data population distribution, and 3) the upper one-sided confidence limits (UCLs) on the true means of the total lead concentrations for different soil mixing scenarios.

5.3 Data Correlation

A test for data correlation is used to verify the quality of the equation used to predict soluble lead concentrations. There should be a correlation coefficient ("r") of 0.8 or greater between total and soluble lead (WET-citric) analytical results. The correlation coefficient of total lead versus soluble lead concentrations for this data set is 0.8876. The correlation factor is discussed in Section 6.1 of the report.

5.4 Regression Analysis

A linear regression analysis is necessary to create a soluble lead prediction model for use with the 90% and 95% UCLs. The model is created by plotting the total lead and soluble lead (WET-Citric) paired data points on a scatter plot chart. A linear regression line is then added to the chart using the equation:

$$y = mx + b$$

where:

y = WET Citric result, mg/l

x = total lead result, mg/kg

b = the y-intercept where the total lead concentration is zero. Theoretically, the y-intercept should also be zero. The larger the y-intercept (either positive or negative) is an indication of the uncertainty of the regression analysis.

$$m = \text{Slope} = \frac{r \times s_t}{s_s}$$

where:

r = correlation coefficient

s_t = standard deviation of the total lead results

s_s = standard deviation of the soluble lead results

The linear equation corresponding to the regression line is then used to predict a soluble lead concentration for the statistical total lead UCLs. The integrity of the equation is directly related to the correlation coefficient described in Section 5.3.

5.5 Population Distribution

A test for population distribution is necessary to apply the appropriate methods when examining the UCLs on the true total lead means. When evaluating the distribution of total lead concentrations, all total lead data from each area were treated as one data set. In accordance with *Chapter Nine, SW-846, 3rd Edition, U.S. Environmental Protection Agency, 1986, (Chapter Nine, SW-846)* distribution was evaluated by comparing the mean versus the variance of the total lead data sets. If the mean was greater than the variance, the data set was assumed to be normally distributed and transformation was not performed. If the mean was less than the variance, the data set was transformed using an arcsine conversion. If the mean was approximately equal to the variance, the data set was transformed using a square root conversion.

5.6 Calculating the Upper Confidence Limits for the True Mean

Statistical confidence limits are the classical tool for addressing uncertainties of a distribution mean. The UCLs of the true mean concentration are used as the mean concentrations because it is not possible to know the true mean. The UCLs therefore account for uncertainties due to limited sampling data. As more data are available for a given site, uncertainty decreases and the UCLs move closer to the true mean.

A 90% UCL is desired if the soil is to be reused on-site and a 95% UCL is desired if the soil is to be disposed of offsite or relinquished to a contractor as described in Task Order No. 07-3N5101-PN. The maximum 90% UCL allowed for re-use of on-site soil is 1,496 mg/kg and the maximum 95% UCL allowed for disposal is 350 mg/kg. The one-sided 90 and 95% UCLs of the true mean are defined as the values that, when calculated repeatedly for randomly drawn subsets of site data, equal or exceed the true mean 90 and 95% of the time, respectively. The following statistical equation (from *Chapter Nine, SW-846*) was used to calculate the UCLs:

$$UCL = \bar{x} + t_p \frac{S}{\sqrt{n}}$$

Where:

\bar{x} = sample mean

t_p = student's t for a one-tailed confidence interval and a probability of p

S = standard deviation

n = number of samples

For the purpose of this investigation, the samples were assumed to be collected using systematic random sampling. *Chapter Nine of SW-846* indicates that if the data set is not normally distributed, the data should be transformed, and statistical evaluations should be performed on the transformed scale.

Using histogram graphical representation (Appendix D), the data did not exhibit a normal distribution. The histogram showed that the data were skewed. Based on this graphical evaluation, the data set should be transformed.

Examination of the data indicated that the mean was less than the variance for the non-transformed data indicating that the data set was not normally distributed and transformation was necessary. The raw data was transformed using the arcsine transformation. The arcsine transformation was accomplished by dividing each total lead result by the maximum concentration (this results in a data set of all numbers falling between 0 and 1), then calculating the arcsine of the quotient. ($y_i = \arcsine(x_i/x_{max})$), performing the statistical calculations on the transformed data, and then re-converting the result to real numbers ($z_i = x_{max} \sin y_i$).

6. CONCLUSIONS

Reuse conclusions were based upon comparison of the referenced 90% transformed UCLs and average WET-DI results to the DTSC variance and AB 414. Conclusions for surplus material and material relinquished to the contractor were based upon comparison of 95% transformed UCLs and predicted WET-Citric results to CCR Title 22 criteria and HSC limit of 350 mg/kg total lead. Results of CCR Title 22 metals analyses were also used in discussing offsite disposal. A summary of the statistical evaluation results and conclusions is provided below.

A review of the data set mean versus statistical variance indicated that the total lead data set is not normally distributed. A histogram showing data distribution is provided in Appendix D. The results also showed that the mean is less than the statistical variance; therefore, an arcsine transformation was applied. The maximum 90% arcsine transformed UCL and WET-Citric concentrations were 138.6 mg/kg and 8.9 mg/l, respectively for the surface to 0.15 m interval. The calculated correlation factor between total lead concentrations and WET-Citric lead concentrations was 0.8876, indicating satisfactory data correlation. The regression analysis chart of total lead vs. soluble lead is provided in Appendix D.

Based upon the 90% arcsine transformed UCLs and average WET-DI results, the upper 0.6 m of soil is suitable for re-use within the Caltrans rights-of-way. Based upon the 95% arcsine transformed UCLs (148.2 mg/kg) and predicted WET-Citric (9.6 mg/l) results, the upper 0.15 m of soil excavated from the site would likely be classified as a hazardous material with respect to soluble lead content as

defined in CCR Title 22. The underlying soil to from a depth of 0.15 m to 0.60 m would likely be classified as a non-hazardous material with respect to lead content. The entire soil column to a depth of 0.6 m would also likely be classified as a non-hazardous material with respect to lead content.

Based upon TTLC results of two samples with the greatest total lead concentrations, other CCR Title 22 metals do not appear to be a concern; however, additional sampling and statistical analyses would be necessary to fully characterize the soil.

TCLP results from the four samples exhibiting the greatest total lead concentrations indicate that the on-site soils would not likely be characterized as a RCRA waste.

7. RECOMMENDATIONS

Geocon recommends that if any portion of the upper 0.30 m of soil is excavated and reused within the Caltrans right-of-way, it should be placed under at least 0.3 m of clean fill and at least 1.5 m above the maximum groundwater elevation to comply with the DTSC Lead Variance. If the upper 0.15 m of soil excavated at the site is to be disposed, it should be handled as a hazardous material with respect to soluble lead. If the entire soil column to a depth of 0.60 m is disposed as a single unit, it should be handled as a non-hazardous material with respect to lead content. Geocon also recommends that Caltrans notify the contractors performing the construction activities that hazardous concentrations of lead may be present in on-site soil and that appropriate health and safety measures should be taken to minimize the exposure to lead.

8. REPORT LIMITATIONS

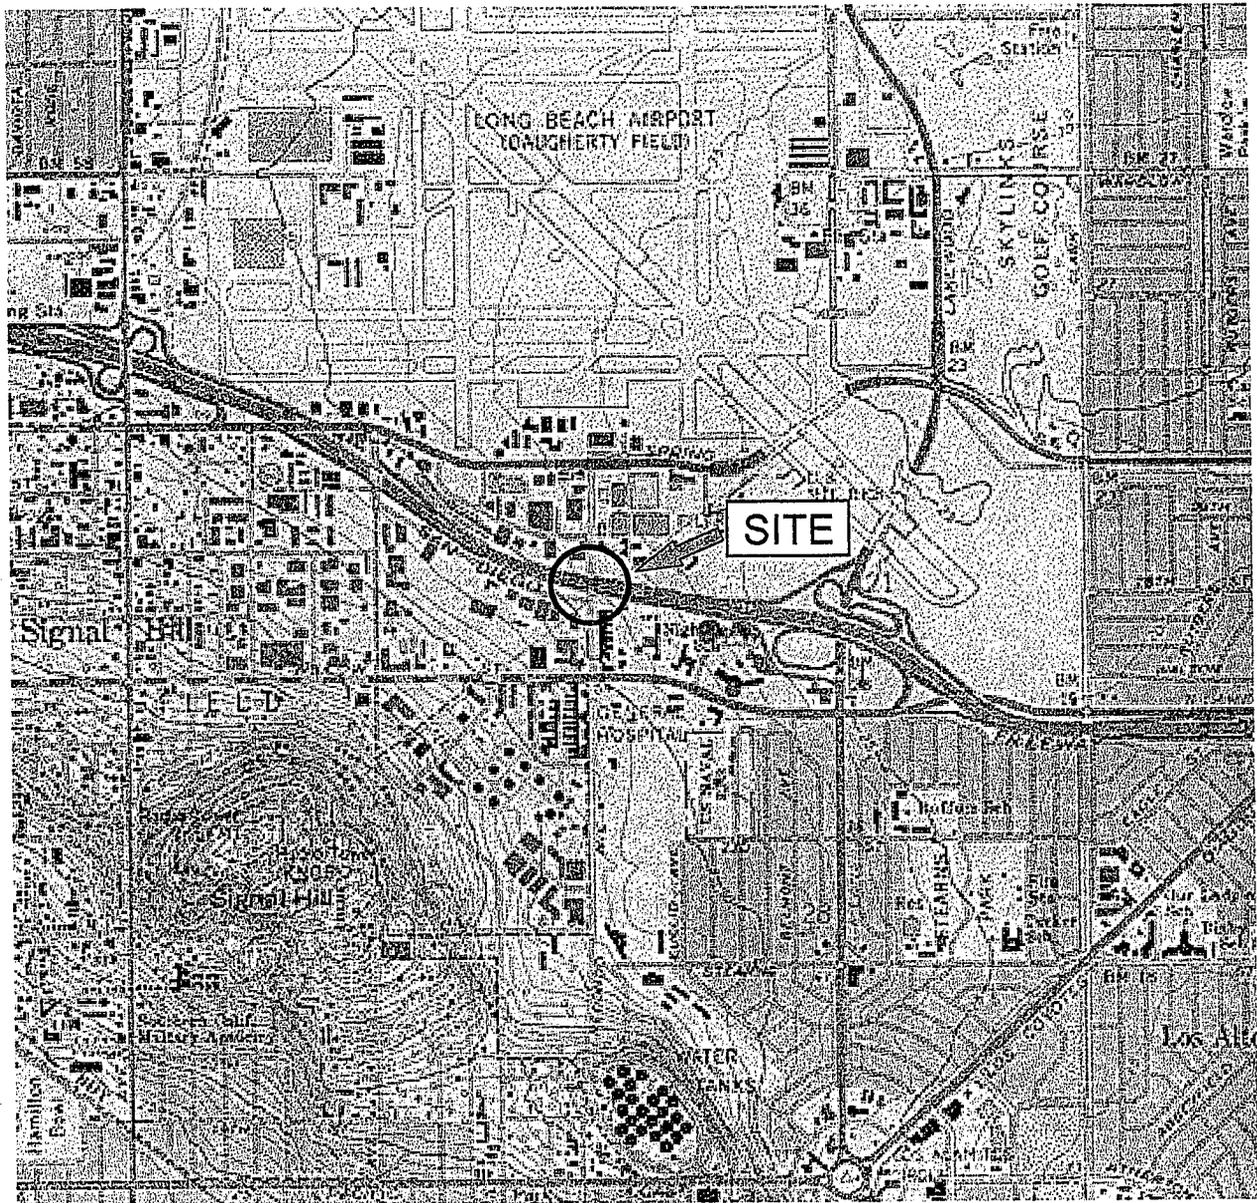

This report has been prepared exclusively for Caltrans. The information obtained is only relevant as of the date of the latest site visit. The information contained herein is only valid as of the date of the report, and will require an update to reflect additional information obtained.

The conclusions and recommendations presented herein are based on a limited number of samples collected from in-place soil and from widely spaced locations according to Caltrans prescribed protocol. The purpose of these sampling and characterization activities was to reasonably predict the character of soil to be disturbed for planned construction activities within the described limits of the Caltrans right of way. The disposition and handling of the soil are governed by the California regulations cited above. Characterization of the soil in the study areas for Federal waste criteria was beyond the scope of work in this Task Order.

Only a limited number of samples were analyzed using the TCLP method used to classify Federal waste. It is possible, that soil disturbed, excavated and stockpiled could exceed Federal standards for hazardous waste and may require handling as a RCRA waste.

The Client should recognize that this report is not a comprehensive site characterization and should not be construed as such. The appropriate regulatory agency may require additional investigations. The findings and conclusions as presented in this report are predicted on the results of the limited soil sampling and laboratory analyses performed. In addition, the information obtained is not intended to address potential impacts related to sources other than those specified herein.

Therefore, the report should only be deemed conclusive with respect to the information obtained. No guarantee or warranty of the results or the report is implied within the intent of this report or any subsequent reports, correspondence, or consultation, either expressed or implied. Geocon strived to perform the services summarized herein in accordance with the local standard of care in the geographic region at the time the services were rendered.

APPENDIX

B

APPENDIX B

GEOCON CONSULTANTS, INC. MODIFIED STANDARD OPERATING PROCEDURE (SOP) NO. 11 HAND-AUGERING AND SOIL SAMPLE COLLECTION/HANDLING

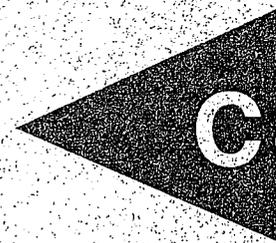

Purpose

The purpose of this SOP is to outline procedures and methods to be used to advance hand-augers and collect soil samples for chemical analyses.

Hand-Augering and Soil Sample Collection/Handling Procedures

1. Initiate boring using a hand-held 7.62 centimeter diameter stainless steel auger.
2. Advance boring to initial sample depth of approximately 0 to 0.15 m below the ground surface.
3. Transfer the soil sample from the hand auger into a plastic bag to homogenize the sample, transfer the sample from the plastic bag to a glass jar supplied by the laboratory. Label glass jar with the boring number, EA number, and sample depth.
4. Record the sample identification, time and date of sample collection, sample matrix type, turn-around time, and container type on the laboratory chain of custody.
5. Each prepared sample jar will be placed into a cooler for transport to Advanced Technology Laboratories.
6. Repeat the procedure and collect soil samples at subsequent depths as specified in the Task Order, if possible.
7. Backfill the borings to surface grade with soil cuttings generated.
8. Clean and rinse sampling equipment prior to the collection of each soil sample by washing the equipment with a non-phosphate detergent followed by subsequent tap water and deionized water rinses.
9. Transport all samples to Advance Technology Laboratories under chain of custody control.

APPENDIX

RE: RTE 405-EA4N4601 - 9100-06-41

Work Order No.: 056590

Attention: Greg Adams

Enclosed are the results for sample(s) received on April 26, 2002 by Advanced Technology Laboratories and tested for the parameters indicated in the enclosed chain of custody.

Thank you for the opportunity to service the needs of your company.

Please feel free to call me at (562)989-4045 if I can be of further assistance to your company.

Sincerely,

Edgar Caballero
Laboratory Director

MAY 17 2002

EXECUTIVE SUMMARY

This Phase II environmental site investigation was prepared for the proposed improvements to the northbound collector ramp for Cherry Avenue at Interstate (I) 405 in Long Beach, California (Project). This report covers the landscaped portion of the Project between the collector onramp and the I-405 right-of-way (ROW) west of Cherry Avenue, a portion that will be excavated during construction of the proposed improvements.

The objective of the Phase II investigation was to evaluate whether soil contamination in the ROW may impact construction activities, and to provide a hazard assessment for the mitigation of impacts during earthwork. The Phase II investigation was also performed so that soil excavation and disposal can be managed properly, and to inform the contractor of potential contamination so that proper mitigation measures can be implemented. Excavated soils are required by State and Federal regulations to be classified as nonhazardous or hazardous prior to reuse as fill or disposal offsite. A remediation plan is beyond the scope of our services.

Determining the extent of the soil excavated for the Project should be based on results of the testing, data analysis, and the reuse potential of excavated soil within the Project corridor. If the soil cannot be reused in the corridor, Project planning should include allowances for managing soil with hazardous levels of contaminants as a regulated waste, usually by disposal at a landfill accepting hazardous or regulated wastes.

Thirty-two soil samples were collected from six boring locations spaced at approximately 100-foot-long intervals along the Project ROW. Samples were typically tested for more than one type of contamination as follows:

- Twenty-five soil locations were tested for aerially deposited lead (ADL). Three samples were tested for Title 22 metals, which included ADL.
- Three soil samples were tested for hydrocarbons and volatile organic compounds (VOCs). An additional sample was also tested for VOCs.

Based on review of analytical test results, DYA recommends the following restrictions for use of the soils within the areas tested for this Project:

- The existing undisturbed soils are not considered potentially hazardous waste until the soils are excavated.
- The ADL testing data was analyzed on a combined layer basis with the samples using statistical methods noted in EPA SW-846. Based on linear regression analysis and statistical analysis for the samples collected, the composite soil will have an ADL total threshold limit concentration (TTLC) greater than 100 milligrams per kilogram (mg/kg) and a lead soluble threshold limit concentration (STLC) greater than 5 milligram per liter (mg/l). Because the STLC is greater than 5 mg/l, it should be classified in accordance with the California Code of Resolutions (CCR) Title 22 as hazardous waste. Most of the higher concentrations of ADL were within the upper 2 feet of soil.
- To reduce the composite levels of ADL of the soils onsite, the upper 1-foot of soil across the site should be removed and disposed offsite as waste. An additional 2 feet of soil (total 3 feet) should be removed in the vicinity of Boring CAB-3 from Station 62+50 to Station 63+75, and an additional foot (total 2 feet) should be removed in the vicinity of Boring CAB-6 from Stations 66+00 to 68+00, approximately. The ultimate extent of the excavation will consist of the area bound by the existing edge of pavement and the limits of the excavation as shown on the plans, as otherwise deemed necessary for construction, or as directed by the Engineer. Upon completion of the recommended removals, the revised linear regression analysis of the remaining composite soil will have a TTLC less than 100 mg/kg, and STLC less than 5 mg/l. Therefore, it is our opinion that the remaining soils at depths below the removal depths will be classified as nonhazardous and there will be no restrictions on the use of the remaining soil excavated for the Project as fill within the corridor.
- The samples with STLC values greater than 5 mg/l were tested for toxicity characterization leaching procedure (TCLP). The results of the eleven tests performed were below the federal regulatory limit of 5 mg/l. The eleven samples were located in the upper 2 feet of soil.

1.0 INTRODUCTION

This Phase II environmental site investigation was prepared for the proposed improvements to the northbound collector ramp for Cherry Avenue at Interstate (I) 405 in Long Beach, California (Project). This report covers the landscaped portion of the Project between the collector onramp and the I-405 right-of-way (ROW) west of Cherry Avenue, as shown on Figure 1, a portion of which will be excavated during construction of the proposed improvements.

The portion of the Project area to be excavated begins approximately 300 feet west of the Cherry Avenue overcrossing, and continues along the alignment of Collector Road 1-N to the intersection with I-405, as shown on the Site Plan, Figure 2. The intent of this Phase II investigation is to screen the Project for lead-impacted soil as well as other contaminants of concern that may affect construction of the proposed Project to comply with the hazardous waste section of the California Environmental Quality Act (CEQA). Recommendations for remediation are not a part of the scope of this work.

Figure 2 - SITE PLAN

2.0 PROJECT BACKGROUND

2.1 DATA REVIEW

An initial site assessment (ISA) checklist was prepared by Kimley-Horn and Associates (Kimley-Horn) for the Project. The ISA checklist identified aerially deposited lead (ADL) and hydrocarbons as potential hazards for this Project.

2.2 HISTORICAL SITE USE

The subject site was undeveloped until approximately 1960, as residential and commercial development increased in the areas adjacent to the site over time. Between 1960 and 1968, I-405 was constructed, at which time the Project site was developed for its present use. The site has remained relatively unchanged since then.

2.3 SITE VISIT

Site visits were performed on September 25, 2008, and October 13, 2008.

2.4 CHEMICALS OF CONCERN

The following descriptions of chemicals of concern are based on the historical land use of the Project vicinity and information gathered in the ISA checklist.

2.4.1 ADL

In soils adjacent to highways, lead has accumulated above natural levels primarily due to historic use of lead antiknock compounds in gasoline. Previous studies show that lead concentrations in near-highway surface soil were commonly highest within the upper 2 feet and decrease with depth (Caltrans, 1998). When soil with elevated lead levels is excavated, the soil becomes a regulated waste. The U.S. Environmental Protection Agency (EPA) and California Department of Toxic Substances (DTSC) have established limit concentrations of lead in waste soil based on specified testing methods that trigger classification of waste soil as a hazardous waste, with guidelines for appropriate disposition (EPA, 2001).

2.4.2 Hydrocarbons

The ISA checklist identified one leaking underground storage tank (LUST) and one site listed as a potential health risk by the State Water Resources Control Board within approximately 1/8 mile of the site. The Project is downgradient of the two sites and may have the potential to affect soil and/or groundwater within the Project area.

2.4.3 Other Metals

Based on previous Phase II investigations performed in Caltrans' ROW, there is potential for elevated levels of other Title 22 metals from multiple sources.

2.5 GEOLOGY AND GROUNDWATER

The Project location is shown on the US Geologic Service (USGS) 7.5 minute quadrangle, Long Beach, California, dated 1964, photo-revised 1981, which is provided in Appendix A. The general ground elevation of the Project area is approximately 55 to 65 feet above mean sea level (MSL) with the freeway and ramp below the surrounding grade. The general Project area drains northeasterly towards the Long Beach Airport.

The Project is located within the southern area of the Los Angeles Coastal Plain, a regional alluvial basin overlying Tertiary sedimentary rocks. The surface of the Project area is mapped as Quaternary non-marine terrace deposits (CDMG, 1962). The Newport-Inglewood fault zone passes northwest to southeast within 1 mile south of the Project area. The active fault is locally manifested by uplifted early Pleistocene sedimentary rock of Signal Hill, 1/2 mile to the south. According to California Department of Water Resources Bulletin 104 (DWR, 1961), unconsolidated alluvial sediments are approximately 1,000 feet thick in the area and contain a series of confined aquifers used for municipal water supplies. Low permeability Tertiary sedimentary bedrock of the Pico formation lies beneath the unconsolidated sediments.

According to DWR Bulletin 104, the groundwater in the Project area is located on the southern margin of the Central Basin Pressure Area of the Los Angeles Coastal Plain. The basin is characterized by confined sandy aquifers separated by intermittent silt and clay aquicludes to a depth of approximately 1,000 feet. The Cherry Hill fault segment of the Newport-Inglewood fault zone, located approximately 1 mile to the south, forms a groundwater barrier for the southern

boundary of the Central Basin. The aquifers are used extensively for drinking water resources in the basin by municipalities, private suppliers, and water districts. According to Water Replenishment District of Southern California, Groundwater Elevation Contour Map Fall 2001, the groundwater level in the first aquifer is located approximately 80 to 100 feet below grade and flows north toward an inland pumping depression within the central area of the Central Basin. There is no significant surface water within 1 mile of the Project site. The Los Angeles River is located approximately 2 miles west of the project site.

3.0 OBJECTIVE

The objective of the Phase II investigation was to evaluate whether soil contamination in the ROW may impact construction activities, and to provide a hazard assessment for mitigating impacts during earthwork. The Phase II investigation was also performed so that soil excavation and disposal can be managed properly and to inform the contractor of potential contamination so that proper mitigation measures can be implemented. Excavated soils are required by State and Federal regulations to be classified as nonhazardous or hazardous prior to reuse as fill or disposal offsite. A remediation plan was beyond the scope of our services.

Determining the extent of the soil excavated for the Project should be based on results of the testing, data analysis, and potential reuse of excavated soil within the Project corridor. Project planning should include allowances for managing soil with hazardous levels of contaminants as a regulated waste, usually by disposal at a landfill accepting hazardous or regulated wastes.

4.0 SCOPE OF WORK

The scope of this Phase II investigation consisted of the following:

- Preparing a work plan.
- Reviewing existing data.
- Preparing a site-specific health and safety plan.
- Notifying Underground Service Alert (USA).
- Collecting soil samples in the field.
- Performing laboratory analyses.
- Developing preliminary conclusions regarding impact of soil contamination on proposed construction.
- Preparing this Phase II report.

To avoid confusion with previous investigations performed adjacent to this site, the boring names were modified from those used in the work plan (i.e., B-2 was changed to CAB-2). No other deviations were made from the work plan.

5.0 SAMPLING METHODOLOGY

The approximate boring locations for environmental soil testing are shown on the Site Plan presented on Figure 2. Guidelines prepared by Caltrans for ADL sampling (1998, 2001) were used to determine the spacing of the borings. The proposed borings were spaced as an average interval of approximately 100 linear feet. The soil samples collected were transported to the laboratory, and soil samples not tested were put on hold for a limited time for potential future testing.

Borings were performed using a hand auger. Four soil samples were collected from each boring with 2-inch-diameter, 6-inch-long stainless steel tubes using a manually driven sampler with a slide hammer. The soil collected in the stainless steel tubes was capped with Teflon sheets and end-caps. The soil samples were collected at the ground surface (0 to 0.5 foot), 1 foot (1 to 1.5 feet), 2 feet (2 to 2.5 feet), and 5 feet (5 to 5.5 feet) below existing grades. Surface debris and vegetation was cleared before the soil samples were collected. The samples were labeled to specify the sample location and depth. The samples were then placed in ziploc bags, placed on ice, and stored inside coolers. Borings were backfilled with bentonite chips, except for the upper 1 foot, which was backfilled with the cuttings. No excess soils were generated during excavation of the borings. Photographs of the boring locations are provided in Appendix A.

Samples tested for volatile organic compounds (VOCs) were collected using an EnCore sampler using EPA method 5035 and the manufacturer's instructions. At the selected sampling locations, a soil sample was taken using a stainless steel sleeve, as described above. The sleeve was removed from the core sampler, and subcored samples were then immediately collected in three 5-gram Encore samplers. The Encore samples were immediately capped, labeled, and placed in the supplied sample bag. The boring locations and sample depths were specified on the sample label.

The soil samples were stored in a pre-chilled ice chest and maintained at 4 degrees Celsius, plus or minus 2 degrees Celsius with wet ice, and kept chilled until delivered to the analytical laboratory. The soil samples were placed in the ice chest to minimize movement during transport.

The quality assurance/quality control (QA/QC) soil samples were labeled such that the samples would not be distinguished as QA/QC samples by the testing laboratory. However, the same labeling convention (i.e., boring location and sample depth) was still used for these samples.

The borings were logged by a staff engineer working under the supervision of a licensed Civil Engineer and a Certified Engineering Geologist. The boring logs document the sample location, sampling procedures, and other pertinent field activities. Logs of the borings are presented in Appendix B. The soil samples were reviewed at DYA's office by the supervising Civil Engineer, with the Certified Engineering Geologist reviewing the boring logs.

Soils encountered in the test borings were classified in general accordance with the ASTM Soil Classification System (ASTM D2488) and presented on boring logs. Chain-of-custody procedures are described in Section 7.2.

6.0 LABORATORY ANALYSIS

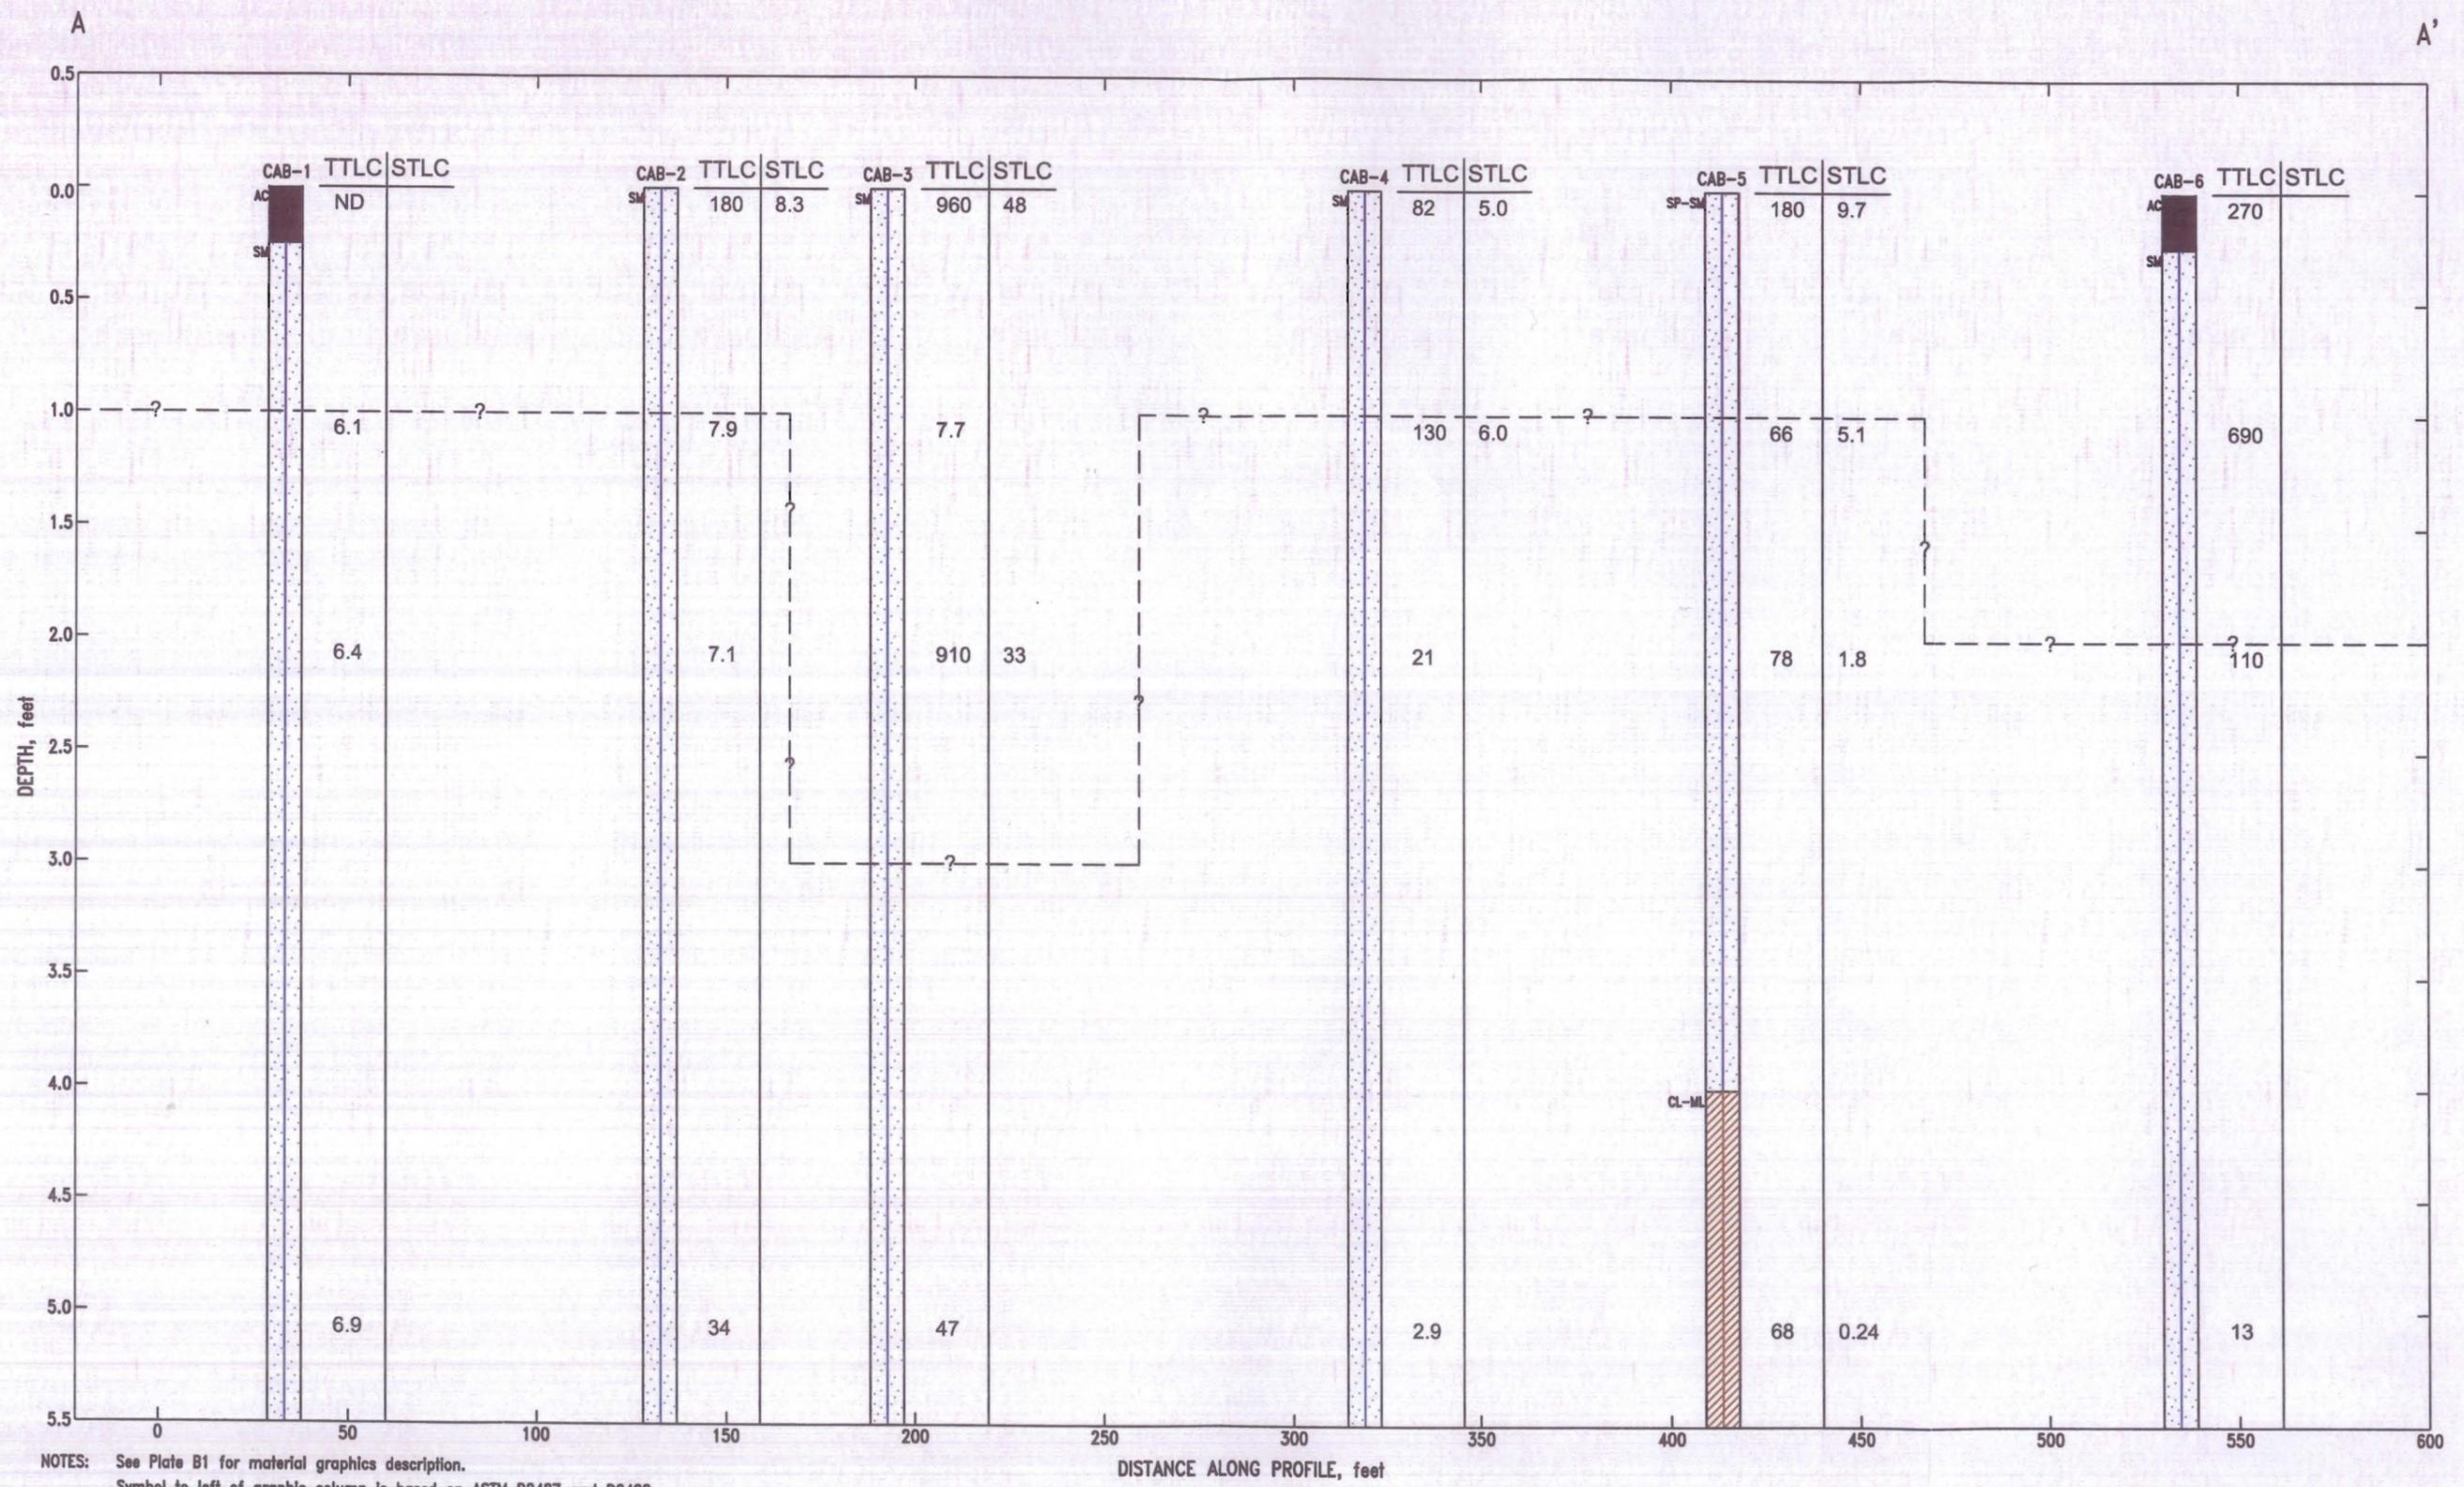

Test America, Inc. in Irvine, California, performed laboratory testing for the Project. Test America, Inc. is certified by the State of California Department of Health Services (DHS) to perform the designated analyses. Laboratory reports are presented in Appendix C.

6.1.1 ADL

Soil samples from each boring were analyzed for lead total threshold limit concentration (TTLC) by U.S. EPA Method 6010B. Caltrans guidelines (2001) recommend that soil samples with lead TTLC less than 1,000 milligrams per kilogram (mg/kg), but greater than or equal to 50 mg/kg, be tested for soluble lead using the California waste extraction test (WET) to determine the soluble threshold limit concentration (STLC) using EPA method 6010B. The eleven soil samples with the greatest TTLC were tested for toxicity characterization leaching procedure (TCLP), using EPA method 6010B. In addition, four soil samples were analyzed for soil pH (EPA 9045C). Three of the soil samples were tested for California Title 22 Metals. A summary of the ADL laboratory test results is presented in Table 1. The laboratory test results are also summarized on the cross section shown on Figure 3. The location of the cross section is shown on Figure 2.

- mg/kg = milligrams per kilogram.
- mg/l = milligram per liter.

6.1.2 Metals

Selected soil samples collected from Borings CAB-1, CAB-3, and CAB-5 were analyzed for the California Title 22 list of 17 hazardous waste metals. Results from these laboratory tests are summarized in Table 2.

Table 2 - METALS LABORATORY TEST RESULTS

	Sb	As	Ba	Be	Cd	Cr	Co	Cu	Pb	Hg	Mo	Ni	Se	Ag	Tl	V	Zn

 - Cd = Cadmium
 - Cr = Chromium (III)
 - Co = Cobalt
 - Cu = Copper
 - Pb = Lead
 - Hg = Mercury
 - Mo = Molybdenum
 - Ni = Nickel
 - Se = Selenium
 - Ag = Silver
 - Tl = Thallium
 - V = Vanadium
 - Zn = Zinc

6.1.3 TRPH and VOC

Soil samples collected were observed visually for hydrocarbon staining and monitored using a photoionization detector (PID) during the field investigation. None of the soil samples indicated elevated levels of hydrocarbons based on the visual observations or PID readings. At a depth of 3 feet below the ground surface (bgs), soil samples at CAB-1 and CAB-4 were tested for total recoverable petroleum hydrocarbons (TRPH, EPA test method 8015 [gas and diesel]) and VOCs (EPA test method 8260); the soil sample collected from CAB-5 at 3 feet was tested for VOCs. The results of the TRPH and VOC laboratory analyses indicate that no further action is warranted.

7.0 QUALITY ASSURANCE/QUALITY CONTROL

7.1 DECONTAMINATION

The sampling equipment was decontaminated prior to collecting each soil sample. The decontamination consisted of washing the equipment and/or sampler in water mixed with a nonphosphate detergent, rinsing with water, rinsing with distilled water, and then drying using paper towels (paper towels were used once.) Brushes were used with the nonphosphate detergent to remove debris from the hand-augering equipment prior to rinsing. Decontamination water was disposed of in the landscaped area such that the water would not run off into a storm drain.

7.2 CHAIN OF CUSTODY

Soil samples were collected in stainless steel tubes and stored in a cooler with ice. EnCore samples collected at the same depth within a boring were placed in a single Ziploc bag, which was then stored in a cooler on ice. A chain-of-custody form was filled out to track the soil samples. The chain-of-custody form traveled with the cooler and documented that the samples were maintained in possession until relinquished to the laboratory. The chain-of-custody form remained with the soil samples at all times and was placed in the cooler with the samples. The completed chain-of-custody form was placed in a waterproof carrier (e.g., zip-lock bag), and taped to the inside lid of the cooler. Each person involved in the chain of possession signed the chain-of-custody form when sample custody was relinquished or received. Custody of a sample is defined as being in one's actual possession, being in one's view after being in his or her physical possession, was in one's physical possession and that person then locked it up to prevent tampering, and/or in an identified and designated secure area. Copies of the chain-of-custody forms are provided with the results of the laboratory testing in Appendix C.

7.3 QUALITY ASSURANCE/QUALITY CONTROL (QA/QC) SAMPLES

7.3.1 Field QA/QC

7.3.1.1 Equipment Blank

Two equipment blanks were collected by pouring deionized water through the sampling device and into a glass jar after decontamination was completed. The testing for the equipment blanks was consistent with the testing performed on samples collected using the equipment. The blank samples were tested for TPH, VOCs, and Title 22 metals. The results for the testing of the equipment blank were below reporting limits.

7.3.1.2 Trip Blank

One trip blank was collected from the ice chest water used to transport samples. The trip blank was analyzed for VOC, and the test results were below reporting limits.

7.3.1.3 Duplicate Blank

Five duplicate blank samples were collected from Boring CAB-4 by co-located samples. For QA/QC purposes, the duplicate blank samples were labeled as having been collected from Boring CAB-7. The testing for the duplicate blanks was consistent with the testing performed on the original co-located samples. The duplicate soil samples collected at depth of 0, 1, 2, and 5 feet bgs were tested for lead, and the sample collected at 3 feet bgs was tested for TRPH and VOCs; the results were considered by DYA to be consistent with the original samples. ADL test results are presented in Table 1.

7.3.2 Laboratory QA/QC

Laboratory QA/QC was performed in accordance with the respective EPA protocols, and is described in the laboratory analysis reports presented in Appendix C.

8.0 INVESTIGATIVE RESULTS AND FIELD OBSERVATIONS

8.1 SUBSURFACE

Soils encountered in the borings generally consisted of silty sand. Groundwater was not encountered during sampling excavations.

8.2 LABORATORY RESULTS

8.2.1 Comparative Guidelines

The following reference guidelines were used for comparison to evaluate the laboratory test results:

- Caltrans/DTSC for ADL, Proposed Soil Lead Management Criteria as Part of Caltrans Highway Construction Maintenance (Caltrans, 1998), and Lead Testing Recommendations for Districts with Aerially Deposited Lead Variance (Caltrans, 2001) was used for evaluation of ADL concentration.
- California Health and Safety Code (HSC), Division 20, Chapter 6.5, Hazardous Waste Control (HSC, 2003) was used for comparison to hazardous waste classification concentrations.
- California Environmental Protection Agency (CAL EPA, 2005), Use of California Human Health Screening Levels (CHHSL) for use in Evaluating Contaminated Properties, guidelines used to compare concentrations of certain hazardous chemical constituents in soil to thresholds of concern for risk to human health.
- Background Concentrations of Trace and Major Elements in California Soils (Kearny, 1996), used as a frame of reference to evaluate for elevated metals in soils.

8.2.2 Lead

A summary of the laboratory results for the discrete soil samples tested for lead is provided in Table 3. As shown in Table 3, none of the discrete soil samples tested had concentrations of lead that exceeded regulatory (CCR Title 22) TTLC of 1,000 mg/kg, but twelve samples exceeded the regulatory STLC of 5 milligrams per liter (mg/l).

Table 3 - SUMMARY OF LABORATORY RESULTS (Lead and pH)

NUMBER OF TESTS								pH (average)
TTLC (mg/kg)				STLC (mg/l)		TCLP (mg/l)		
<50	50 to 350	350 to 1,000	>1,000	≤5	>5	≤5	>5	
13	12	3	0	3	12	11	0	8.1
Notes: <ul style="list-style-type: none"> • TTLC = Total threshold limit concentration = EPA Method 6010. • STLC = soluble threshold limit concentration. • DI-WET = California STLC method with deionized water. • mg/kg = milligrams per kilogram. • mg/L = milligrams per liter. 								

The samples with STLC values greater than 5 mg/l were tested for toxicity characterization leaching procedure (TCLP). The results of the eleven tests performed were below the federal regulatory limit of 5 mg/l.

8.2.3 pH

The values of pH varied from 6.8 to 8.4 and the average value is summarized in Table 3. None of the discrete soil samples tested had pH levels less than 5.

8.2.4 Title 22 Metals

None of the discrete soil samples tested for Title 22 metals, except lead, had concentrations that exceeded the regulatory TTLC values for hazardous waste specified in the California Code of Regulations Title 22.

8.2.5 TRPH and VOC

The results of the TPH and VOC laboratory analyses indicate that the concentrations recorded in the samples tested do not exceed regulatory limits.

9.0 ADL DATA EVALUATION AND DISCUSSION

9.1 ADL DATA ANALYSIS

Results of the ADL laboratory tests were evaluated using statistical analysis methods prescribed by Caltrans guidelines for ADL. DYA analyzed the lead testing data on a combined layer with all the samples using statistical methods noted in EPA SW-846. The mean, median, standard deviation, and 95 percent upper confidence limit (UCL) were calculated for TTLC. A regression analysis of TTLC versus STLC was performed to determine the correlation between the total lead and soluble lead for which the data is a bivariate with a linear structure, as shown on Figure 4. STLC was a predicted value corresponding to the 95 percent UCL for TTLC based on the regression analysis. The regression analysis also served as a quality check of field and laboratory procedures.

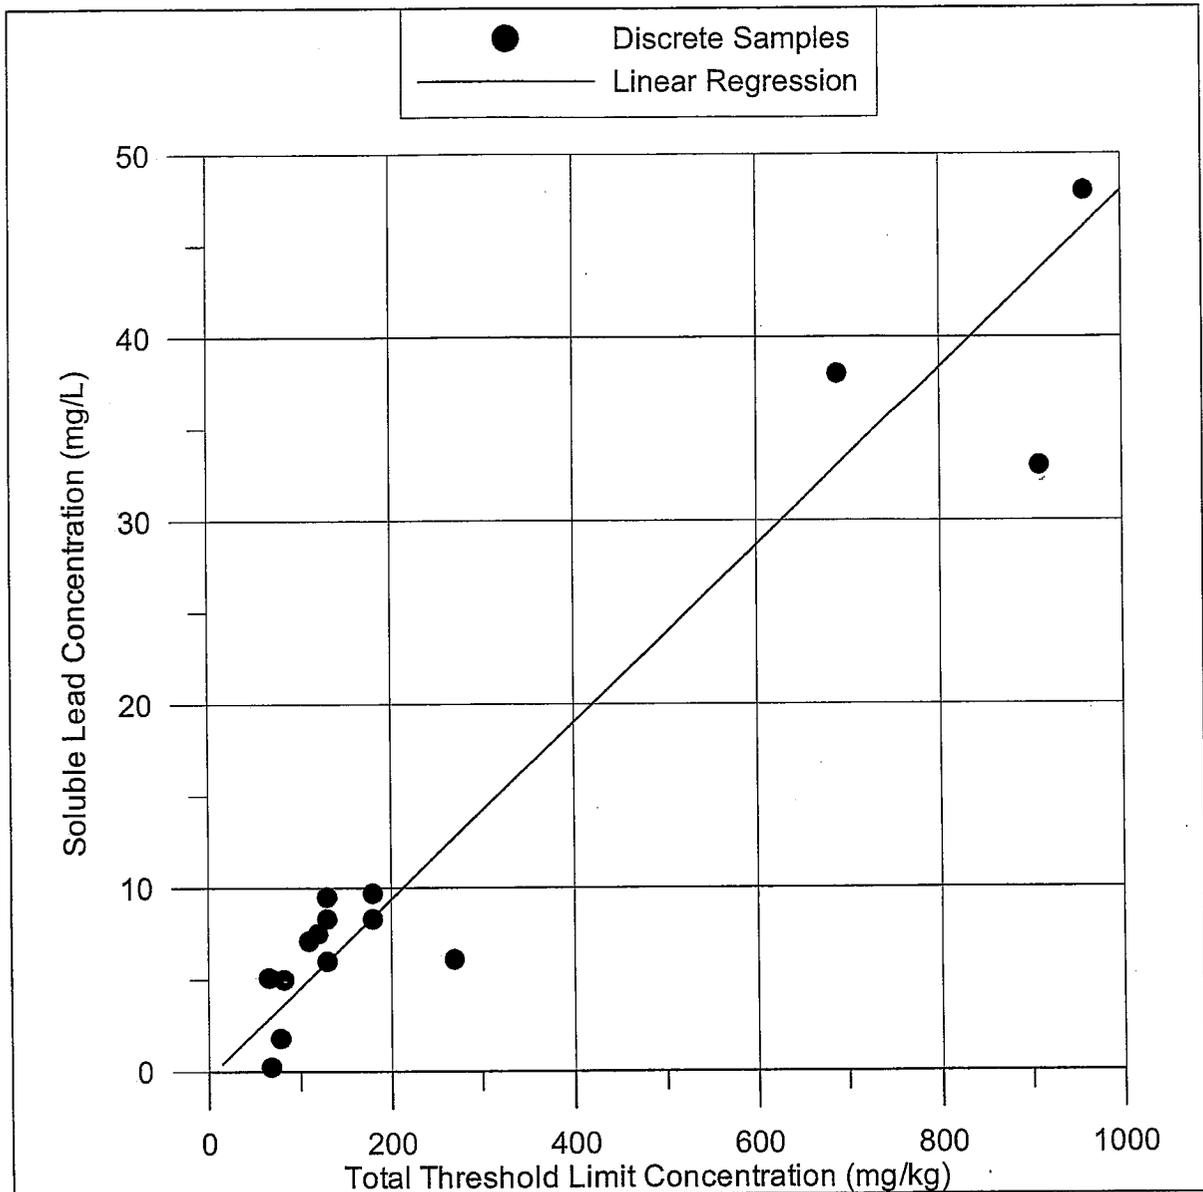

Figure 4 - CORRELATION OF TOTAL LEAD TO SOLUBLE LEAD

The data sets were checked for the appropriate number of samples, and in the datasets, the number of samples tested for TTLIC exceeded the minimum number required for a statistical analysis according to EPA SW-846.

The 95 percent UCL values were used to determine handling and disposal of excess soil in accordance with CCR Title 22 (1,000 mg/kg regulation limit). The analysis was performed to obtain an efficient management of soil using a combined layer analysis.

9.2 ADL CRITERIA

Waste soil is classified as hazardous waste if the TTLC is greater than 1,000 mg/kg or greater than 5 mg/L STLC.

9.3 ADL STATISTICAL EVALUATION

Statistical analyses were performed on a combined layer using an arcsine transformation in accordance with EPA SW-846, since the TTLC variance was higher than the TTLC mean. The calculated 95 percent UCL was then reverse transformed to obtain the concentration values. The combined layer did not exceed the threshold for nonhazardous waste of 1,000 mg/kg TTLC content or 5 mg/l STLC content. The analysis is provided in Appendix D.

As specified in the Caltrans ADL Guidelines (2002), the correlation coefficient between TTLC and STLC was calculated to evaluate the quality of sampling procedures and laboratory testing. Based on the data set, the correlation coefficient was calculated to be 0.96.

A linear regression analysis of the STLC versus TTLC was graphed and a best fit line was plotted for the data, as shown on Figure 4. A least squares method was used to estimate a straight line correlation. This graph can be used to approximate the expected STLC from the TTLC.

10.0 CONCLUSIONS AND RECOMMENDATIONS

The existing undisturbed soils are not considered potentially hazardous waste until the soil is excavated. Based on linear regression analysis and statistical analysis for the samples, the existing soils, if left in place, will have a TTLC concentration greater than 100 mg/kg, and a corresponding STLC concentration greater than 5 mg/l. Because the STLC is greater than 5 mg/l, it should be classified by CCR Title 22 as hazardous waste. Most of the higher concentrations of lead were within the upper 2 feet of soil.

To reduce the ADL levels in the composite soil that will remain onsite, the upper 1-foot of soil across the site should be removed and disposed offsite as waste. Also, an additional 2 feet of soil (total 3 feet) should be removed in the vicinity of Boring CAB-3 between Stations 62+50 and 63+75, and an additional foot (total 2 feet) should be removed in the vicinity of Boring CAB-6 between Stations 66+00 and 68+00, approximately. The recommended depths of removal for the site are displayed graphically on Figure 3. The ultimate extent of the excavation will consist of the area bound by the existing edge of pavement and the limits of the excavation as shown on the plans; as otherwise deemed necessary for construction; or as directed by the Engineer. Upon completion of the recommended removals, the revised linear regression analysis of the composite soil remaining on site will have a TTLC of less than 100 mg/kg, and STLC less than 5 mg/l. Therefore, it is our opinion that there are no restrictions on the use of the remaining soil excavated at the Project as fill within the corridor or disposed offsite.

10.1 USE OF SOIL ONSITE

The statistical results indicated that after the recommended removals have been performed and disposed offsite, waste soil generated by earthwork or excavation in the remaining upper 5 feet will be below 1,000 mg/kg TTLC and 5 mg/l STLC. In our opinion, after the initially excavated soils have been disposed offsite, there will be no restrictions on the use of the remaining soil excavated at the Project site. If the soil is not used within the corridor as described above, the excavated soil stockpile should be tested to determine the appropriate waste disposal as discussed in Section 10.2.

10.2 WASTE

10.2.1 Classification of Waste

The soils to be removed and disposed offsite had a statistical TTLC concentration greater than 650 mg/kg with a correlated STLC concentration greater than 5 mg/l. Waste with TTLC levels greater than 1,000 mg/kg or STLC levels greater than 5 mg/L are in excess of California hazardous waste criteria and must be disposed of in a Class I hazardous waste landfill. In addition, waste with TCLP levels greater than 5 mg/l are in excess of federal hazardous waste criteria and must be disposed of in a Class I hazardous waste landfill. A remediation specialist should be consulted for options other than disposal offsite. The remaining soils below the recommended removals had a statistical TTLC concentration of less than 100 mg/kg with a correlated STLC concentration less than 5 mg/l. There is no restriction on disposal of soil with TTLC less than 1,000 mg/kg and STLC less than 5 mg/L, but excavated soil stockpiles should be tested prior to disposal.

The contractor should prepare a project-specific lead compliance plan to prevent or minimize worker exposure to lead while handling material containing ADL. Attention is directed to Title 8, California Code of Regulations, Section 1532.1, "Lead," for specific California Department of Industrial Relations, Division of Occupational Safety and Health (Cal-OSHA) requirements when working with lead.

10.2.2 Disposal Volume

The volume of soil to be disposed will depend on actual grading activities. The actual limits of the excavation are unknown at this time. Soils at depths greater than the proposed removals are considered nonhazardous and should not have restrictions on disposal. The volume of nonhazardous soils is unknown at this time.

11.0 LIMITATIONS

This report was prepared for this project in accordance with generally accepted geotechnical engineering practices common to the local area. No other warranty, expressed or implied, is made.

The analyses and recommendations contained in this report are based on the literature review, field investigation, and laboratory testing conducted in the area. The results of the field investigation indicate subsurface conditions only at the specific locations and times, and only to the depths penetrated. They do not necessarily reflect strata variations that may exist between such locations.

The validity of our recommendations is based in part on assumptions about the stratigraphy. Observations during construction can help confirm such assumptions. If subsurface conditions different from those described are noted during construction, recommendations in this report must be reevaluated.

This report is intended for use only for the project described. In the event that any changes in the nature, design, or location of the facilities are planned, the conclusions and recommendations contained in this report should not be considered valid unless the changes are reviewed and conclusions of this report modified or verified in writing by DYA. We are not responsible for any claims, damages, or liability associated with the interpretation of subsurface data or reuse of the subsurface data or engineering analyses without our express written authorization.

DATA QUALIFIERS AND DEFINITIONS

- I** Internal Standard recovery was outside of method limits. Matrix interference was confirmed.
- L** Laboratory Control Sample and/or Laboratory Control Sample Duplicate recovery was above the acceptance limits. Analyte not detected, data not impacted.
- M1** The MS and/or MSD were above the acceptance limits due to sample matrix interference. See Blank Spike (LCS).
- M2** The MS and/or MSD were below the acceptance limits due to sample matrix interference. See Blank Spike (LCS).
- MX** The MS and/or MSD were outside of the acceptance limits due to sample matrix interference. See Blank Spike (LCS).
- RL4** Reporting limit raised due to insufficient sample volume.
- Z** Due to sample matrix effects, the surrogate recovery was below the acceptance limits.
- ZX** Due to sample matrix effects, the surrogate recovery was outside the acceptance limits.
- ND** Analyte NOT DETECTED at or above the reporting limit or MDL, if MDL is specified.
- RPD** Relative Percent Difference

ADDITIONAL COMMENTS

For Volatile Fuel Hydrocarbons (C6-C12):

Volatile Fuel Hydrocarbons (C6-C12) are quantitated against a gasoline standard.

For Extractable Fuel Hydrocarbons (EFH, DRO, ORO) :

Unless otherwise noted, Extractable Fuel Hydrocarbons (EFH, DRO, ORO) are quantitated against a Diesel Fuel Standard.

Subject: **SLOPE REVIEW at 07-LA-NB405 P.M. 0.45, Studdebaker St. UC, Bridge #53-1187**

As requested, a field review (ISA) was conducted on March 5, 2010, to evaluate the fill slope conditions at the Abutments 1 and 5 of Studdebaker Street bridge along the northbound lane of LA-405 San Diego Freeway at P.M. 0.45.

The fill slope is part of the Studdebaker Street Undercrossing (UC) and is located next to bridge structure (Br. #53-1187). The abutment is approximately 15 feet high with an overall slope ratio of 1.5H:1V. The slope material consists of sandy silt with some clay. The slope bears no vegetation below the structure. Based on field observations the slope appears to be grossly stable in general at the present time. However, moderate erosion of the fill slope material due to a concentrated surface water flow from the top of the structure has occurred.

Recommendations

This erosion process will continue if no mitigative measure is taken. We highly recommend that an emergency project be initiated to reconstruct this section of the fill slope following Section 19 of the Standard Specifications. In order to avoid further erosion, we recommend that HQ-Structure Maintenance be made aware of this erosion problem and request them to review the site and provide recommendations for the abutments. D7 Hydraulics should be consulted for the fill slope abutments drainage recommendations.

Subject: **SLOPE REVIEW at 07-LA-NB405 P.M. 2.7, Willow Street Bridge #53-1480**

As requested, a field review (ISA) was conducted on March 5, and 8, 2010, to evaluate the fill slope conditions at the Abutment 1 of Willow Street bridge, between Clark Str. and Lakewood Blvd., along the northbound lane of LA-405 San Diego Freeway at P.M. 2.7.

The fill slope is part of the Willow Street Undercrossing (UC) and is located next to bridge structure (Br. #53-1480). The abutment is approximately 20 feet high with an overall slope ratio of 1.5H:1V. The slope material consists of sandy silt with some clay. The slope bears no vegetation below the structure. Based on field observations the slope appears to be grossly stable in general at the present time. However, moderate to severe erosion of the fill slope material due to a concentrated surface water flow from the top along the northeast-side of the structure has occurred, exposing the foundation of Abutment 1 of the subject bridge structure.

Recommendations

This erosion process will continue if no mitigative measure is taken. We highly recommend that an emergency project be initiated to reconstruct this section of the fill slope following Section 19 of the Standard Specifications. In order to avoid further erosion, we recommend that HQ-Structure Maintenance be made aware of this erosion problem and request them to review the site and provide recommendations for the abutment. D7 Hydraulics should be consulted for the fill slope abutment drainage recommendations on this side of abutment.

Subject: **SLOPE REVIEW at 07-LA-NB405 P.M. 2.9, Willow Street Bridge #53-1480**

As requested, a field review (ISA) was conducted on March 5, and 8, 2010, to evaluate the fill slope conditions at the Abutment 5 of Willow Street bridge along the northbound lane of LA-405 San Diego Freeway at P.M. 2.9.

The fill slope is part of the Willow Street Undercrossing (UC) and is located next to bridge structure (Br. #53-1480). The abutment is approximately 20 feet high with an overall slope ratio of 1.5H:1V. The slope material consists of sandy silt with some clay. The slope bears no vegetation below the structure. Based on field observations the slope appears to be grossly stable in general at the present time. However, moderate to severe erosion of the fill slope material due to a concentrated surface water flow from the top along the northeast-side of the structure has occurred, exposing the foundation of Abutment 5 of the subject bridge structure. The northwest-side of the fill slope abutment experienced minor to moderate erosion.

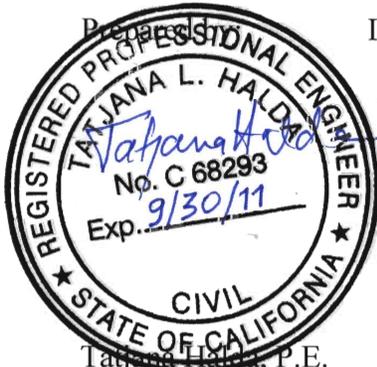

Recommendations

This erosion process will continue if no mitigative measure is taken. We highly recommend that an emergency project be initiated to reconstruct this section of the fill slope following Section 19 of the Standard Specifications. In order to avoid further erosion, we recommend that HQ-Structure Maintenance be made aware of this erosion problem and request them to review the site and provide recommendations for the abutment. D7 Hydraulics should be consulted for the fill slope abutment drainage recommendations on this side of abutment.

Subject: **SLOPE REVIEW at 07-LA-NB405 P.M. 7.3, LA River Bridge**

As requested, a field review (ISA) was conducted on March 4, and 8, 2010, to evaluate the fill slope conditions along the northbound lane of LA-405 San Diego Freeway at P.M. 7.3.

The fill slope is part of the N/B 405 Freeway to N/B 710 Freeway Connector and is located next to bridge structure (Br. #53-1209). The abutment is approximately 15 feet high with an overall slope ratio of 2H:1V. The slope material consists of sandy silt with some clay. The slope bears some vegetation on the side and no vegetation below the structure. Based on field observations the slope appears to be grossly stable in general at the present time. However, severe erosion of the fill slope material due to a concentrated surface water flow from the top along the northeast-side of the structure has occurred, exposing the foundation of Abutment 1 of the subject bridge structure.

Recommendations

This erosion process will continue if no mitigative measure is taken. We highly recommend that an emergency project be initiated to reconstruct this section of the fill slope following Section 19 of the Standard Specifications. In order to avoid further erosion, we recommend that HQ-Structure Maintenance be made aware of this erosion problem and request them to review the site and provide recommendations for the abutment. D7 Hydraulics should be consulted for the fill slope abutment drainage recommendations on this side of abutment.

The northwest-side of the fill slope abutment has also experienced moderate erosion. Based on the field observations it appears to be related to the less height of the berm at the top of the slope and surface water flow from the top. In order to avoid further erosion on this side of the fill slope abutment, increasing the height of the berm at the top of the slope or the construction of a drainage drop-inlet at this location is advisable. D7 Hydraulics should be consulted for this matter.

Mr. Hamid Saadatnejadi, Senior T.E.

Subject: **SLOPE REVIEW at 07-LA-SB405 P.M. 10.5, South of Carson On-Ramp**

A field review (ISA) was conducted on March 5, and 8, 2010, to evaluate the fill slope condition just south of Carson On-Ramp, PM10.5 along southbound 405 Route, in LA County.

The fill slope along the subject location is approximately 10 to 15 ft high with an overall slope ratio 2H:1V. The slope material consists of silty sands and clayey sands. The slope bears some irrigated ice plants. Based on field observations the slope appears to be grossly stable in general at the present time. There is a concrete paved channel for collection of surface water at the bottom of slope.

Moderate erosion and washout of the fill material has occurred at one location along the slope for approximately top 20 ft down the slope. Portions of shoulder had failed at the top of eroded slope for about 12 ft in length. The primary cause of erosion of the fill material is concentrated water flow from heavy rain down the slopes.

Recommendations

This erosion process will continue if no mitigative measure is taken. We highly recommend that an emergency project be initiated to reconstruct this section of the fill slope following Section 19 of the Standard Specifications. Prior to slope reconstruction and in order to avoid further erosion slope need to be cleaned from the debris and loose soil should be removed. Portions of failed shoulder need to be repaired. Engaging the Landscape Design for replanting and vegetation should be done when slopes are reconstructed to its original state.

Subject: **SLOPE REVIEW at 07-LA-SB405 P.M. 4.3-4.5, Between Temple and Spring St.**

A field review (ISA) was conducted on March 5, and 8, 2010, to evaluate the fill slope condition on top of retaining wall between Temple and Spring Street, PM 4.3-4.5 along southbound 405 Route, in LA County.

The fill slope on top of retaining wall at the subject location is approximately 6 ft high with an overall slope ratio 2H:1V. Retaining wall is approximately 22 to 24 ft height. The slope material consists of silty sands to sandy silts. The slope is sparsely vegetated. Based on field observations the slope on top of retaining wall appears to be grossly stable in general at the present time. There is a concrete paved channel for collection of surface water from the City of Long Beach Public Works yard at the top of slope.

Moderate to severe erosion and washout of the fill material has occurred along the slope causing the gullies. Sandy soil was washed out down the slope and retaining wall to the roadway during the recent heavy storm. The primary cause of erosion of the fill material is concentrated water flow from heavy rain down the slopes. This erosion was additionally induced by water from the contractor's water pump of the on going City of Long Beach's Public Works construction drainage project. This issue was referenced by our Office in another report (1-6-2010) issued for an adjacent slope erosion along the southbound lanes of LA-405 San Diego Freeway at Temple Avenue OC, P.M. 4.33

Recommendations

The City of Long Beach Public Works should be made aware of these issues, and their contractor should be requested immediately to implement and/or improve their NPDES and BMPs in order to avoid mud from entering on the travelled way of the Freeway.

We highly recommend that an emergency project be initiated to reconstruct this section of the fill slope following Section 19 of the Standard Specifications. Engaging the Landscape Design for replanting and vegetation should be done when slopes are reconstructed to its

Mr. Hamid Saadatnejadi, Senior T.E.

March 24, 2010

Page 2

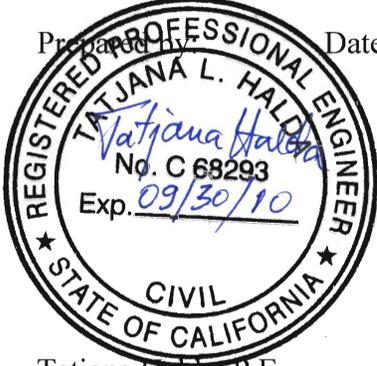

original state. The concrete channel, above the slopes, need to be inspected for damages and repaired if needed, and should be kept clean to avoid flooding during the future rainy season.

If you have any questions and/or further assistance is required please contact Tatjana Halda at (213) 620-2347 or Shiva Karimi at (213) 620-2146.

Subject: SLOPE REVIEW at 07-LA-SB405 P.M. 4.9, Cherry Ave. On-Ramp

As requested, Office of Geotechnical Design South 1 (OGDS1) representatives visited the subject slope site located at southbound Cherry Avenue On-Ramp to southbound Route 405 at Post Mile 4.9 on July 20, 2011.

The eroded slope area is approximately 115 feet long measured along the north side shoulder of the On-ramp to Route 405. The descending fill slope is approximately 15 to 20 feet high with an overall existing slope ratio of 1H:1V. The slope surface material consists of silty fine sand with some clay and gravel. The slope bears some vegetation in the surface. Based on field observations the slope appears to be globally stable at the present time.

OGDS1 believes that erosion of the fill slope material is due to the heavy rain storms and concentrated surface water runoff from the top of the slope.

Recommendations

OGDS1 recommends that eroded area of slope face be regarded to slope ratio of 1.5 H:1V in accordance with Section 19 of Caltrans Standard Specifications (May 2006).

1. Loose and soft materials should be removed from eroded slope area. The depths and extents of removal should be identified in the field by OGDS1 representative.
2. Upon completion of the removals, a shear key should be excavated at the bottom of the slope along the entire length of slope. The width and depth of shear key will be determined by OGDS1 representative.
3. Exposed slope surface should be benched with bench heights no greater than 3 feet.

4. A subdrain should be placed along the slope bottom. The subdrain should consist of Schedule 80 (or 40), perforated PVS pipe having a diameter of 4 inches, encased in a minimum 1 cubic foot/foot length of $\frac{3}{4}$ inch gravel that is wrapped in geotextile.
5. Properly moisture conditioned fill should be placed in horizontal layers that are no more than 8 inches in thickness, and should be compacted to 95% relative compaction in accordance to Caltrans 216 test method.
6. In order to avoid creeping of the new fill, use of geogrid is required. The vertical spacing between geogrids should be approximately 3 feet.
7. The grade above the slope should be constructed to drain away from slope face.

If you have any questions and/or further assistance is required please contact Akbar Mehrazar at (949) 440-3415 or Shiva Karimi at (213) 620-2146.

Subject: **SLOPE REVIEW at 07-LA-SB405 P.M. 4.7, Cherry Ave. Off-Ramp**

A field review (ISA) was conducted on March 4, and 6, 2010, to evaluate the cut slope condition at the Cherry Ave. Off-Ramp, along southbound 405 Route, in LA County.

The cut slope along the subject locations is approximately 20 to 25 ft high with an overall slope ratio 2H:1V. The slope material consists of silty sands, sandy silts, and clayey sand. The slope bears some irrigated ice plants. Based on field observations the slope appears to be grossly stable in general at the present time. There is a concrete paved V ditch channel for collection of surface water at top of the slope.

Moderate to severe erosion and washout of the cut material has occurred along the slope causing gullies. Sandy soil was washed out to the bottom of slope and over the roadway during recent heavy storm. The primary cause of erosion of the cut material is concentrated water flow from heavy rain down the slopes at all eroded locations. Numerous interconnected gopher holes were noticed on the slopes. Subsequent flooding caused piping within the interconnected burrows with resulting significant enlargement of holes and slope erosion.

Recommendations

This erosion process will continue if no mitigative measure is taken. We highly recommend that an emergency project be initiated to reconstruct these sections of the cut slopes following Section 19 of the Standard Specifications. Prior to slope reconstruction and in order to avoid further erosion slopes need to be cleaned from the debris and loose soil should be removed. Office of Maintenance-D07 should evaluate gophers impact in respect to slope erosion and take an appropriate measures if required. Engaging the Landscape Design for replanting and vegetation should be done when slopes are reconstructed to its original state.

Subject: SLOPE REVIEW at 07-LA-SB405 P.M. 5.7, Atlantic Slip Ramp

A field review (ISA) was conducted on March 4, and 8, 2010, to evaluate the cut slope condition at the Atlantic Blvd Slip Ramp, PM5.7 along southbound 405 Route, in LA County.

The cut slope along the subject locations is approximately 28 ft high with an overall slope ratio 2H:1V. The slope material consists of silty sands, sandy silts, and clayey sand. The slope bears some irrigated ice plants. Based on field observations the slope appears to be grossly stable in general at the present time. There is a cleaned, concrete paved V ditch channel for collection of surface water at top of the slope.

Moderate to severe erosion and washout of the cut material has occurred along the slope. Sandy soil was washed out to the bottom of slope and over the roadway during recent heavy storm. The primary cause of erosion of the cut material is concentrated water flow from heavy rain down the slopes at all eroded locations. Numerous interconnected gopher holes were noticed on the slopes. Subsequent flooding caused piping within the interconnected burrows with resulting significant enlargement of holes and slope erosion.

Recommendations

This erosion process will continue if no mitigative measure is taken. We highly recommend that an emergency project be initiated to reconstruct these sections of the cut slopes following Section 19 of the Standard Specifications. Prior to slope reconstruction and in order to avoid further erosion slopes need to be cleaned from the debris and loose soil should be removed. Office of Maintenance-D07 should evaluate gophers impact in respect to slope erosion and take an appropriate measures if required. Engaging the Landscape Design for replanting and vegetation should be done when slopes are reconstructed to its original state.

Subject: SLOPE REVIEW at 07-LA-SB405 P.M. 5.7, Atlantic Blvd. On-Ramp

A field review (ISA) was conducted on March 4, and 8, 2010, to evaluate the cut slope condition at the Atlantic Blvd On-Ramp (two locations), PM5.7 along southbound 405 Route, in LA County.

The cut slope at the beginning of on-ramp is approximately 28 ft high with an overall slope ratio 1.5H:1V, and about 17 ft high at the second location about 100 ft down the on-ramp, with an overall slope ratio of 1.5H:1V. The slope material consists of silty sands to sandy silts. The slope bears some irrigated ice plants. Based on field observations the slope appears to be grossly stable in general at the present time.

Moderate to severe erosion and washout of the cut material has occurred at the two locations along the slope causing the gullies. Portions of shoulder had failed at both eroded sites. A crack in the shoulder that extends for about 40 ft was observed near by the second washout. The primary cause of erosion of the cut material is concentrated water flow from heavy rain down the slopes at all eroded locations. Numerous interconnected gopher holes were noticed on the slopes. Subsequent flooding caused piping within the interconnected burrows with resulting significant enlargement of holes and slope erosion.

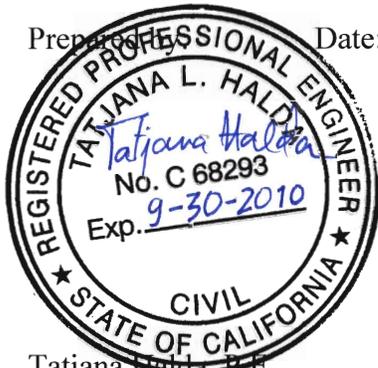

Recommendations

This erosion process will continue if no mitigative measure is taken. We highly recommend that an emergency project be initiated to reconstruct these sections of the cut slopes following Section 19 of the Standard Specifications. Prior to slope reconstruction and in order to avoid further erosion slopes need to be cleaned from the debris and loose soil should be removed. Portions of failed shoulder at both locations need to be removed and repaired. Office of Maintenance-D07 should evaluate gophers impact in respect to slope erosion and take an appropriate measures if required. Engaging the Landscape Design for replanting and vegetation should be done when slopes are reconstructed to its original state.

1.0 INVESTIGATION SUMMARY

As requested by the State of California, Department of Transportation (DOT), ENVIRON International Corporation (ENVIRON) performed additional soil sampling along a portion of the southbound Interstate 405 Freeway off-ramp at Atlantic Avenue, in Long Beach, California (Figures 1 and 2). The work was conducted on behalf of Home Depot U.S.A., Inc. (The Home Depot) as part of its plan to widen the off-ramp, and in accordance with the DOT's requirements, as specified in the Encroachment Permit Rider and subsequent February 1, 2002 letter.

In its February 1, 2002 letter to The Home Depot, the DOT requested additional soil sampling to characterize the degree of Aerially Deposited Lead (ADL) contamination in the soil in all areas of the off-ramp to be disturbed during the lane-widening project. ENVIRON prepared a memo outlining a scope of work, including a map depicting sample locations, to respond to the DOT's request; the scope of work was approved by the DOT on February 26, 2002. The approved scope of work consisted of drilling and sampling eight additional soil borings along the south side of the off-ramp using the direct push drilling method. At each soil boring location, samples were collected at the surface (0 to 0.5 feet), and from approximately 1 to 1.5 feet, 2 to 2.5 feet, 3 to 3.5 feet, 4 to 4.5 feet, and 5 to 5.5 feet.

All 48 soil samples collected were analyzed for total lead in accordance with U.S. Environmental Protection Agency (EPA) Method 6010, and pH. Lead was not detected in any of the samples at concentrations above the Total Threshold Limit Concentration (TTLC) for lead. However, lead was detected in five of the soil samples at concentrations ranging from 73 milligrams per kilogram (mg/kg) to 290 mg/kg, which exceeds 10 times the Soluble Threshold Limit Concentration (10 x STLC) for lead; four of the five samples were collected from the surface (0 to 0.5 feet).

In accordance with the Lead Testing Guidance Table provided in the DOT's February 1, 2002 letter, subsequent analysis using the citrate Waste Extraction Test (WET) was performed on the five samples in which lead concentrations exceeded 10 x STLC; results of the WET indicated that two of the samples exceeded the 5.0 mg/l STLC for lead, at STLC concentrations of 6.9 mg/l and 9.1 mg/l. Both samples were collected at the surface (0-0.5 feet).

In addition, in accordance with the approved scope of work, 10 of the soil samples exhibiting the highest concentrations of lead were analyzed for the full suite of metals California Code of Regulations [CCR] Title 22 metals; the sample with the highest lead concentration was also

analyzed for volatile organic compounds (VOCs) and semi-volatile organic compounds (SVOCs) in accordance with EPA Methods 8260B and 8270, respectively. Metals were not detected in any of the 10 soil samples at concentrations exceeding the respective TTLC or 10 x STLC concentrations. In addition, VOCs and SVOCs were not detected above laboratory reporting limits in the samples analyzed for VOCs and SVOCs.

Following receipt of the analytical results, statistical analysis of the samples was performed in accordance with EPA SW-846 and the additional DOT requirements as specified by the DOT in its February 1, 2002 letter.

Based on the results of the soil sampling described herein, and the results of the statistical analysis performed on the soil sample results, it is ENVIRON's conclusion that the 95% upper confidence limit (UCL) does not exceed the TTLC or STLC for any of the metals analyzed for at the site. Therefore, additional sampling of soil, or special handling of soil, other than standard construction practices for dust control to be implemented during the lane widening project, is not warranted

2.0 INTRODUCTION

ENVIRON International Corporation (ENVIRON) was retained by The Home Depot to conduct additional soil sampling along a portion of the southbound Interstate 405 Freeway off-ramp at Atlantic Avenue, in Long Beach, California (Figures 1 and 2). The work was conducted as part of The Home Depot's plan to widen the off-ramp, and was performed in accordance with Department of Transportation's (DOT's) requirements as specified in the Encroachment Permit Rider, and its subsequent request for additional sampling dated February 1, 2002. The additional soil sampling was performed on March 1, 2002.

On October 31, 2001, at the direction and approval of DOT, two soil borings were drilled and sampled in the same approximate area that the current sampling was performed (see Figure 1, sample locations SB1-1 and SB2-S), and six soil samples were collected and analyzed for the California Code of Regulation [CCR] Title 22 metals. The detected metals concentrations were compared to the respective Total Threshold Limit Concentrations (TTLCs) and Soluble Threshold Limit Concentrations (STLCs). Results of this comparison indicated that none of the metals exceeded the respective TTLCs; however, lead was detected in two samples (SB1-1 and SB2-S) at concentrations that exceeded 10 times the STLC. As a result, the Waste Extraction Test (WET) was performed on both samples, and the STLC for lead (5.0 milligrams per liter (mg/l)) was exceeded in one of the samples, SB2-S, in which it was detected at a concentration of 11 mg/l. This sample was subsequently analyzed using the Toxic Characteristic Leaching Procedure (TCLP) for lead; the sample result showed that lead was not detected. Results of this earlier soil sampling were submitted to the DOT on November 20, 2001 and have been included in this report for reference purposes (see Table 3). In addition, the results of the earlier work have been incorporated into the statistical evaluation.

3.0 OBJECTIVE AND SCOPE OF WORK

3.1 Objective

The objective of the additional soil sampling as described herein was to comply with the request of the DOT in its February 1, 2002 letter, in which it was requested that the potential presence of Aerially Deposited Lead (ADL) in the soil in the area of the off-ramp to be disturbed be more fully assessed.

3.2 Scope of Work

The scope of work designed to meet the objective described above included the following:

- Preparation of a site-specific health and safety plan.
- Completion of a geophysical survey to evaluate the presence of buried utilities and lines.
- Collection and laboratory analysis of 48 soil samples from eight shallow soil borings.
- Evaluation of the sample results by performing statistical analysis.
- Preparation of this report.

4.0 SCOPE OF WORK

4.1 Field Mobilization

Prior to the start of the subsurface investigation, ENVIRON subcontracted with Spectrum Geophysics (Spectrum) of San Fernando, California, to evaluate the potential presence of buried utilities in the areas of proposed sampling. The purpose of this evaluation was to minimize potential damage to buried utilities and pipelines, and injuries to personnel that could ensue from encountering such lines during subsurface sampling (i.e., gas leaks, electric shock). In addition, a site-specific health and safety plan was prepared prior to the initiation of fieldwork. The health and safety plan was designed to minimize potential exposure to ENVIRON field personnel.

ENVIRON notified the DOT of its sampling schedule; personnel from the DOT were present during a portion of the drilling and sampling activities.

4.2 Soil Sampling

ENVIRON retained Environmental Support Technologies (EST) to collect soil samples from eight soil borings using the direct push drilling method. Soil boring locations are provided on Figure 1. Soil samples were collected at depths of approximately 0 to 0.5 feet, 1 to 1.5 feet, 2 to 2.5 feet, 3 to 3.5 feet, 4 to 4.5 feet, and 5 to 5.5 feet in each soil boring using a slide hammer sampler lined with an acetate sleeve. Once each sample was collected, the acetate sleeves were removed from the sampler, sealed with Teflon tape and plastic end caps, labeled, stored on ice in a closed container, and delivered to the laboratory on the same day that they were collected, under chain-of-custody procedures.

Soil samples were submitted to Del Mar Analytical of Irvine, California, a California State-certified laboratory, for analysis. All 48 soil samples were analyzed for total lead in accordance with the Environmental Protection Agency (EPA) Method 6010, and pH. Subsequent analysis using the WET was performed on the soil samples that exceeded 10 x STLC for lead. In addition 10 of the soil samples exhibiting the highest concentrations of total lead were analyzed for the full suite of metals (CCR Title 22 metals); one of those samples was also analyzed for volatile organic compounds (VOCs) and semi-volatile organic compounds (SVOCs) in accordance with EPA Methods 8260B and 8270, respectively. Analytical results are presented and discussed in the following section.

5.0 DATA EVALUATION AND DISCUSSION

5.1 Soil Sample Evaluation

Total lead was detected in all 48 soil samples at concentrations above the laboratory reporting limits (see Table 1). However, only five samples exceeded 10 x the STLC, SB4-0-0.5 (290 milligrams per kilograms (mg/kg)), SB5-0-0.5 (170 mg/kg), SB7-0-0.5 (73 mg/kg), SB8-0-0.5 (73 mg/kg), and SB10-0-0.5 (90 mg/kg). Subsequent analysis of the five samples using the WET procedure was performed; the STLC for lead (5.0 mg/l) was exceeded in two of the samples, samples SB4-0-0.5 (9.1 mg/l) and SB5-0-0.5 (6.9 mg/l) (see Table 1).

Arsenic, barium, chromium, cobalt, copper, lead, mercury, nickel, vanadium, and zinc were detected in most of the 10 soil samples analyzed for CCR Title 22 metals; none of the metals detected exceeded the respective TTLCs or 10 x STLCs (see Table 2).

Measured pH values ranged from 6.70 to 9.53; the lower end of the range occurs more commonly, while the higher end of the range is suggestive of very alkaline soils.

VOCs and SVOCs were not detected in the soil sample (sample SB4-0-0.5) analyzed using EPA Methods 8260b and 8270 at concentrations above the laboratory reporting limits.

Laboratory reports for all analysis performed are provided in Appendix A.

In addition, as indicated previously, for reference purposes, soil sample results for the previous soil sampling are summarized in Table 3, and provided in full in Appendix B.

5.2 Statistical Evaluation

ENVIRON performed statistical analysis of the most recent and historical sample results, as described in SW-846 and the DOT's February 1, 2002 letter. The statistical comparison of the data to the regulatory thresholds is based on the assumption that the data are represented by a normal distribution. When a data set is not normally distributed, SW 846 suggests a data transformation to achieve normality. According to this guidance, if the simple test of comparing the average to the variance fails (the data are not normally distributed) a square root or arcsin transformation is acceptable. The test for normality fails (assume the data set is not normal) when the variance is greater than twice the average.

Table 4 provides a summary of the statistical analysis performed on the metals results. The descriptive statistics are quantity of samples reported below detection limit, quantity of samples reported as detected concentrations, total quantity of samples, minimum, maximum, median, average, and variance. Additionally, the table includes the test statistic (variance over the average), the results of the normality test, the transformation method if applicable, the 95% upper confidence limit (UCL) on the mean (one-tailed), the STLC, the TTLC, and the results of comparing the 95% UCL to the appropriate threshold.

Ten compounds were detected frequently enough to calculate 95% UCLs. Of the ten, eight failed the test for normality and required transformation. Arsenic, chromium, nickel, and vanadium data were transformed using the square root method. Barium, copper, lead, and zinc data were transformed using the arcsin method. Cobalt and mercury did not require a transformation. None of the 95% UCLs for the metals exceeds the appropriate TTLC.

Seven of the samples exhibited concentrations of total lead in excess of 10 x STLC, and were subsequently analyzed by the laboratory for soluble lead. The soluble lead results were compared to the total results using linear regression (Figure 3). A best-fit line was calculated and the resulting slope (0.0437 kg/l) and y-intercept (negative 1.5136 mg/l) were used to establish a solubility factor equation. The 95% UCL for soluble lead was calculated by multiplying the 95% UCL for total lead (50.5 mg/kg) by the slope and adding the y-intercept value. The resulting value, 0.69 mg/l, is less than the STLC for lead (5 mg/l).

Histograms of the data are provided in Appendix C.

6.0 CONCLUSIONS

As requested by the DOT, ENVIRON performed additional soil sampling along a portion of the southbound Interstate 405 Freeway off-ramp at Atlantic Avenue, in Long Beach, California. The DOT requested additional soil sampling to characterize the degree of ADL contamination in the soil in all areas of the off-ramp to be disturbed during the lane-widening project. Eight additional soil borings were drilled and sampled on March 1, 2002.

Forty-eight soil samples were analyzed for total lead and pH. Lead was not detected in any of the samples at concentrations above the TTLC for lead. However, lead was detected in five soil samples at concentrations exceeding 10 x STLC; the WET was performed on the five samples and the results indicated that two of the samples exceeded the STLC for lead. None of the calculated UCLs for lead exceeded either the STLC (5 mg/l) or the TTLC (1,000 mg/kg). Measured pH values ranged from 6.70 to 9.53. In addition, 10 of the soil samples were analyzed for CCR Title 22 metals, and one sample was analyzed for VOCs and SVOCs. Metals were not detected in any of the 10 soil samples at concentrations exceeding the respective TTLC or 10 x STLC concentrations and VOCs and SVOCs were not detected.

Following receipt of the analytical results, statistical analysis of the samples was performed in accordance with EPA SW-846 and the additional DOT requirements as specified by the DOT in its February 1, 2002 letter.

Based on the results of the soil sampling described herein, and the results of the statistical analysis performed on the soil sample results, it is ENVIRON's conclusion that the 95% UCL does not exceed the TTLC or STLC for any of the metals analyzed for at the site. Therefore, additional sampling of soil, or special handling of soil, other than standard construction practices for dust control to be implemented during the lane-widening project, is not warranted.

Selenium	ND	ND	ND	ND	ND	ND	10	100	1
Silver	ND	ND	ND	ND	ND	ND	50	500	5
Thallium	ND	ND	ND	ND	ND	ND	70	700	7
Vanadium	19	20	27	24	29	23	240	2,400	24
Zinc	91	80	38	170	50	45	2500	5,000	250
WET (STLC Metals), Lead	NA	1.4	NA	11	NA	NA			

Notes:

ND: Not-detected

NA: Not Analyzed

mg/kg: milligrams per kilogram

mg/l: milligrams per liter

10 x STLC: 10 times Soluble Threshold Limit Concentration

TTLC: Total Threshold Limit Concentration

STLC: Soluble Threshold Limit Concentration

WET: Waste Extraction Test

SB-1-1: Soil boring number with associated depth

SB-1-S: Soil boring number, sample collected at the surface (s)

TABLE 4
Statistical Summary of Soil Sample Analytical Results

Notes:
Calculations executed with 1/2 detection limit substitution for non-detects.

ND = Not detected

na = not applicable

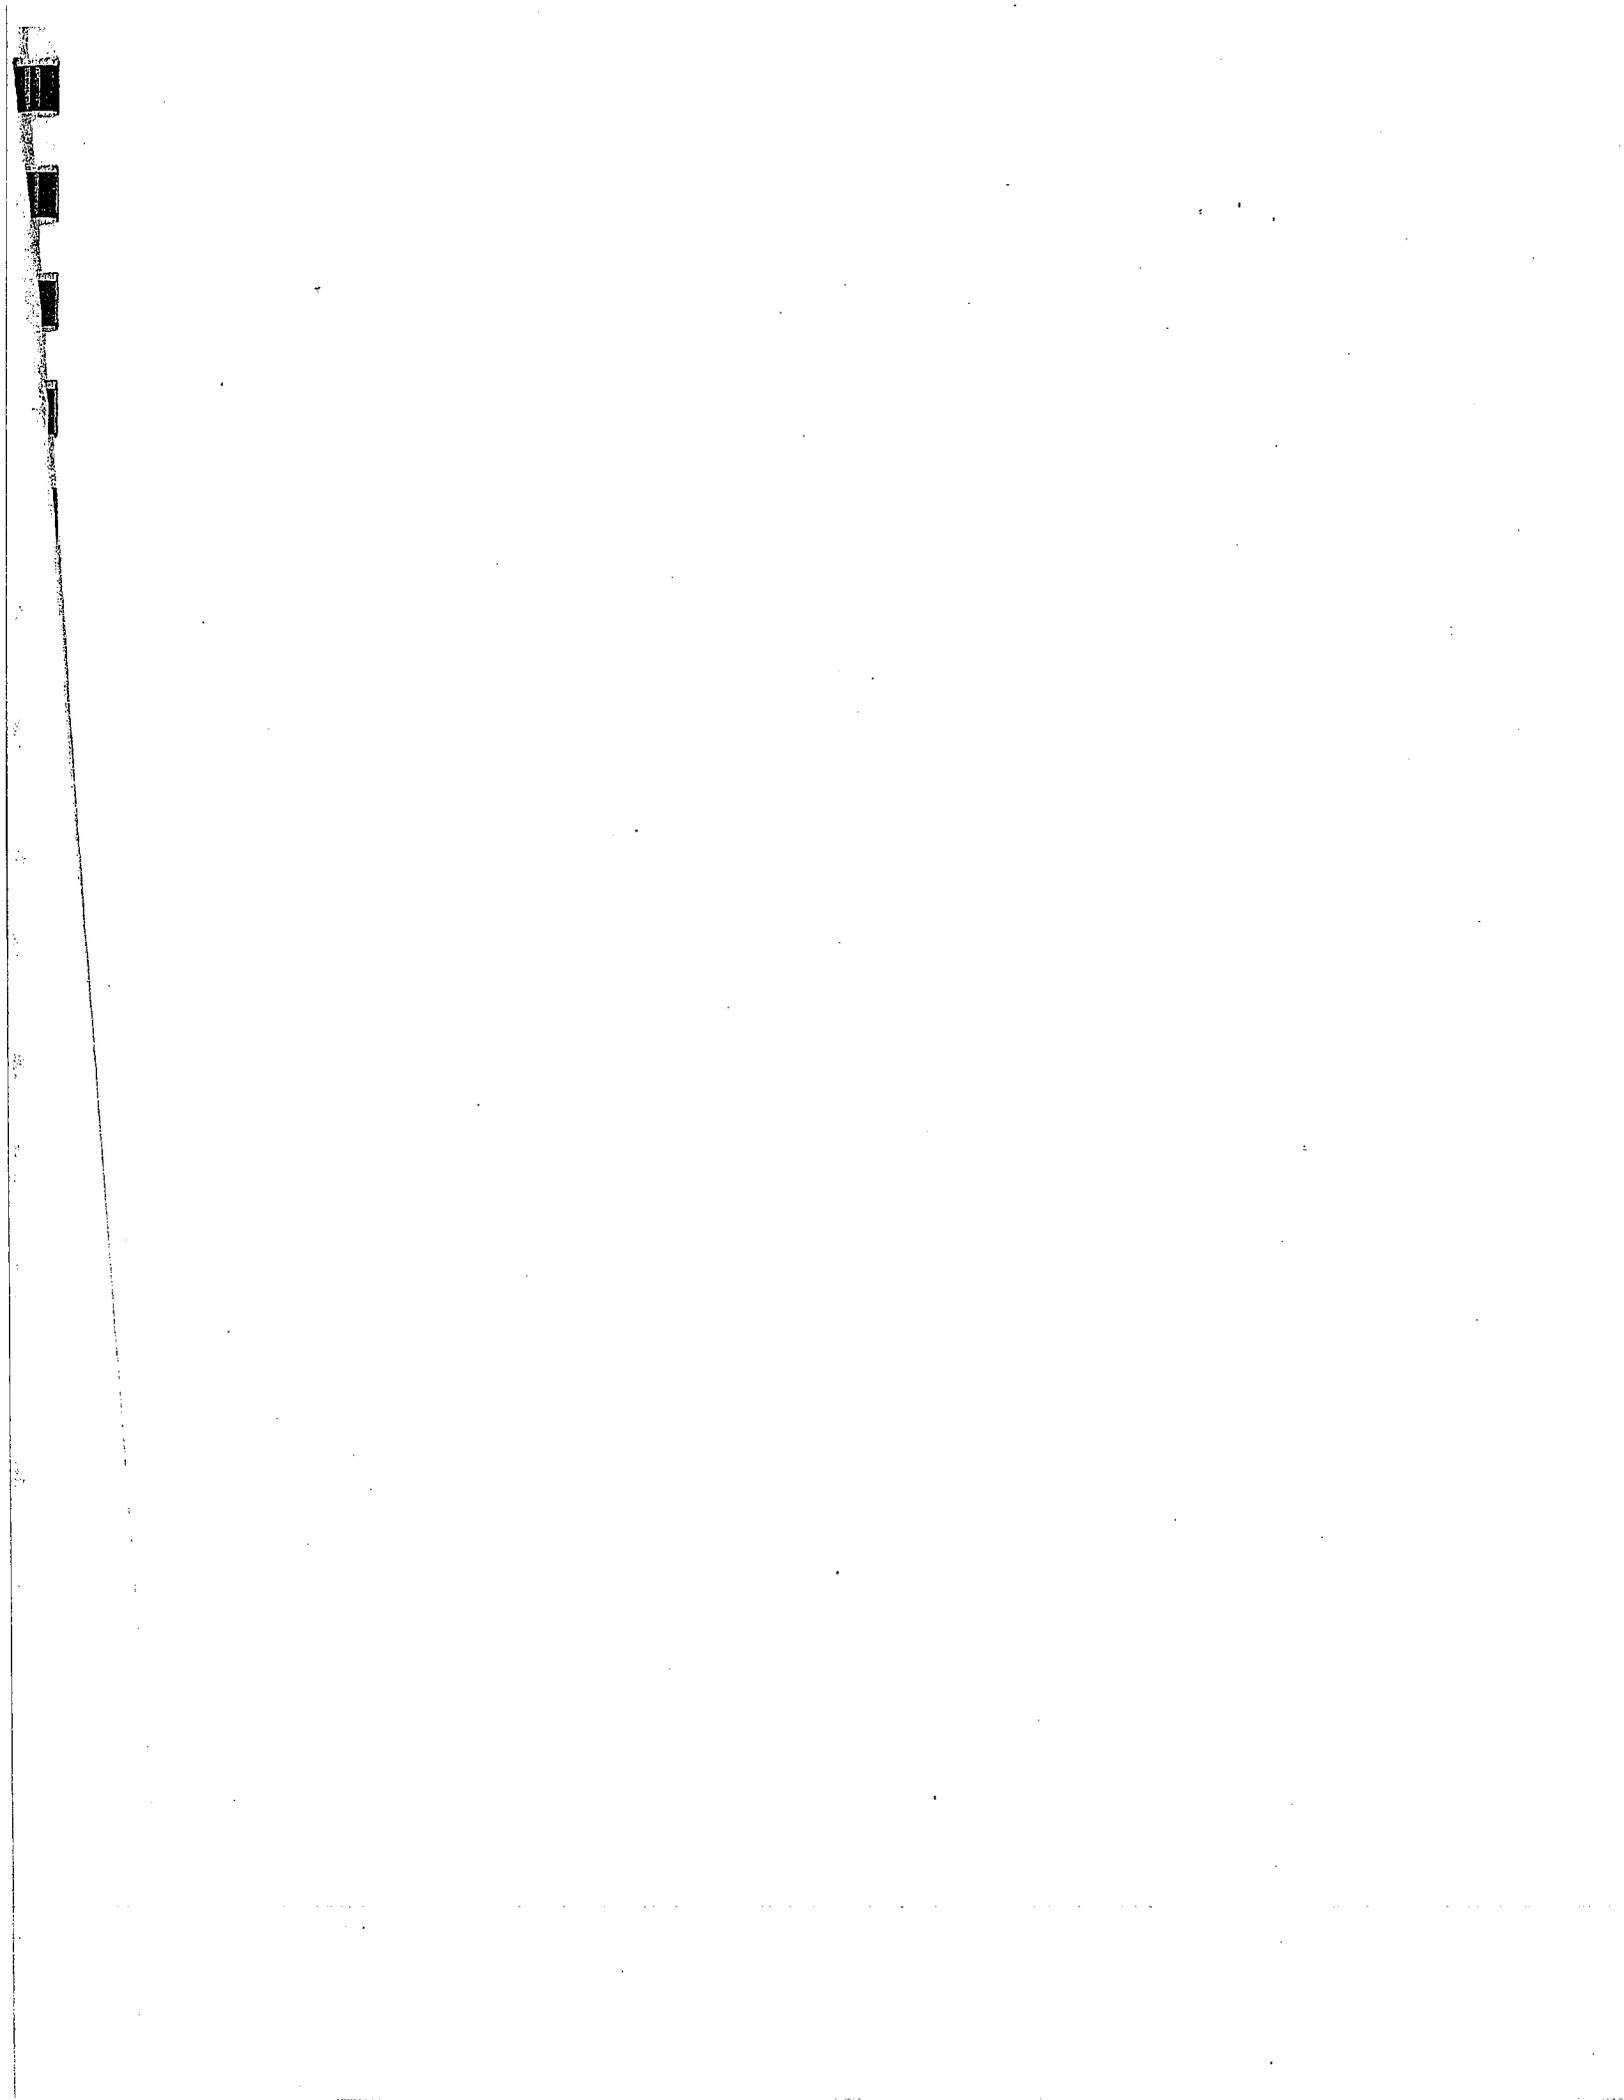

mg/kg = milligrams per kilogram

mg/l = milligrams per liter, STLC data only

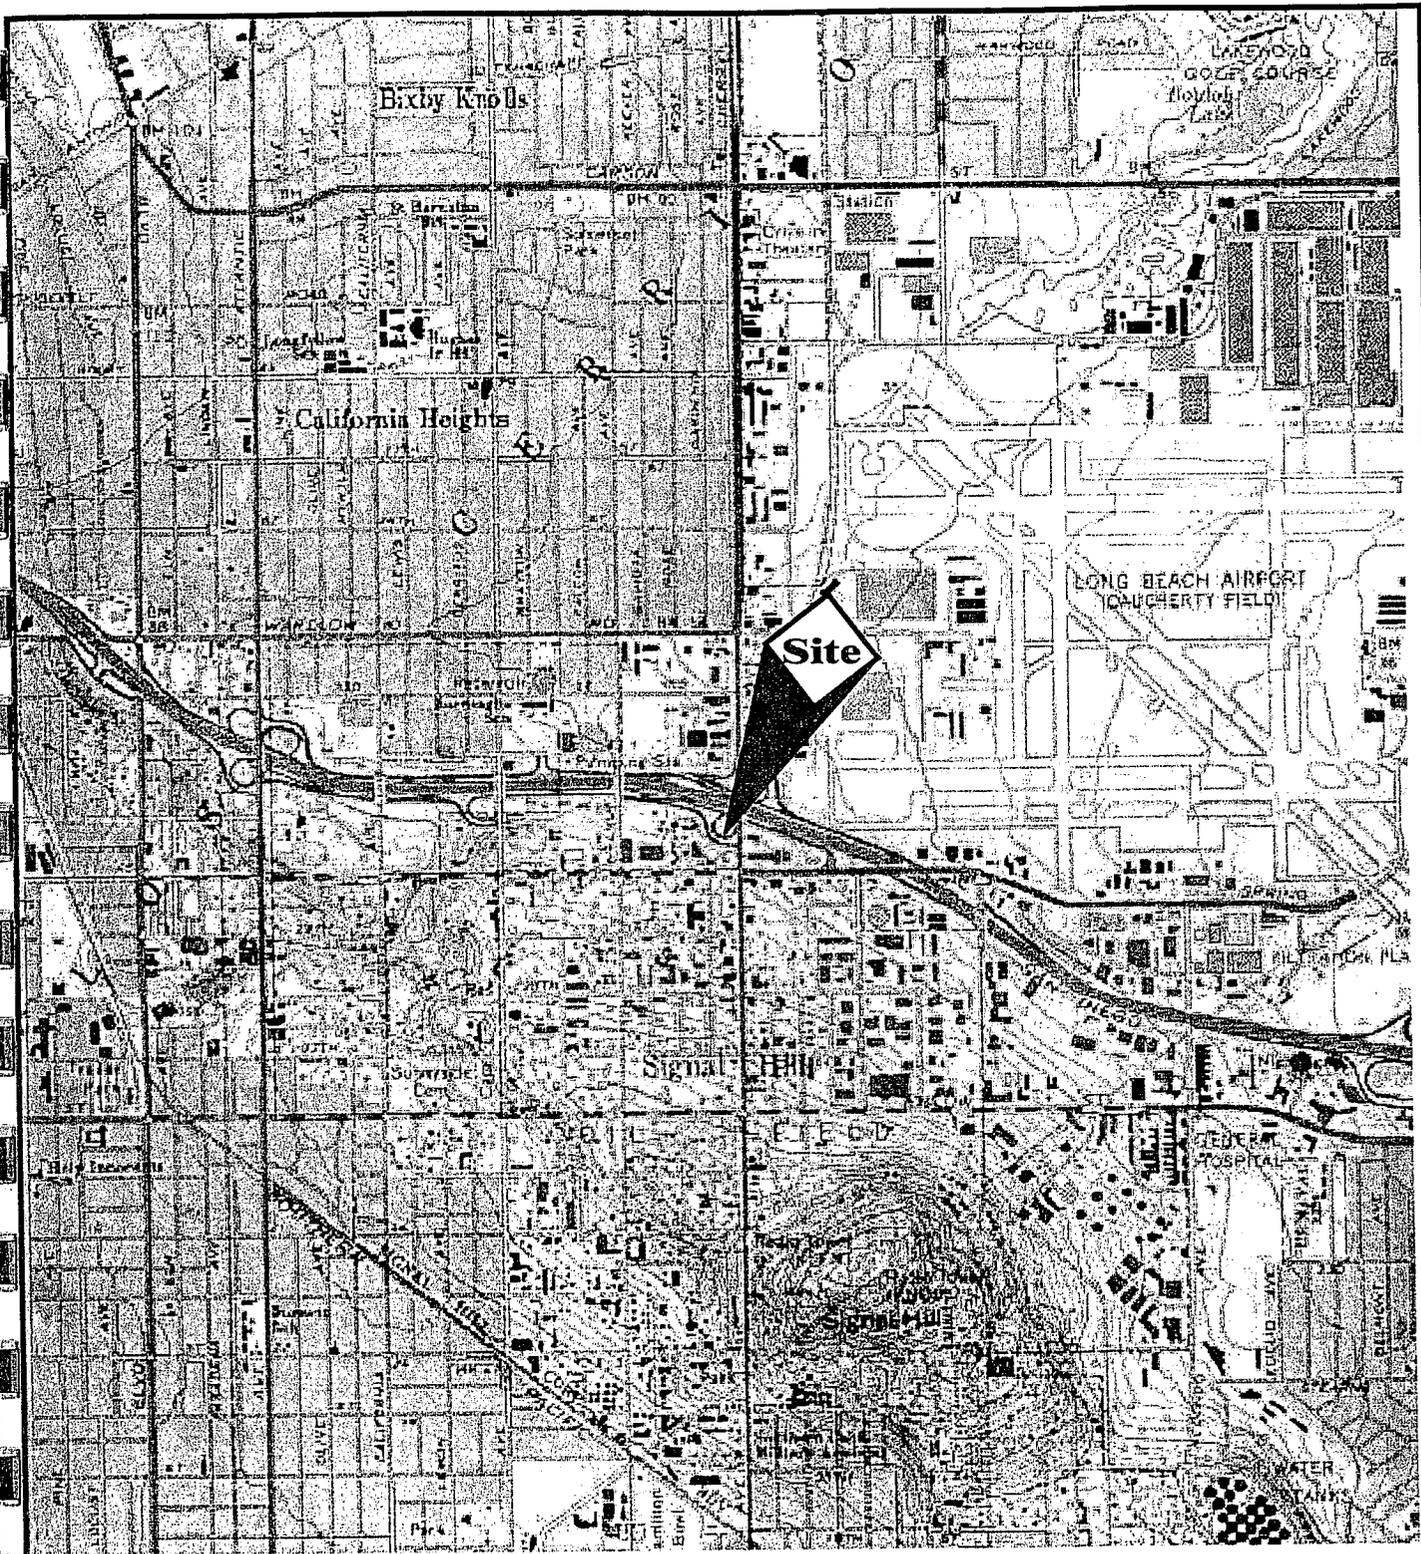

STLC = Soluble Threshold Limit Concentration

TTLc = Total Threshold Limit Concentration

* 95% UCL calculated from the 95%UCL of total lead and the regression of soluble lead and total lead.

DATA QUALIFIERS AND DEFINITIONS

- M1** The MS and/or MSD were above the acceptance limits due to sample matrix interference. See Blank Spike (LCS).
- M2** The MS and/or MSD were below the acceptance limits due to sample matrix interference. See Blank Spike (LCS).
- R-3** The RPD exceeded the method control limit due to sample matrix effects.
- ND** Analyte NOT DETECTED at or above the reporting limit or MDL, if MDL is specified.
- NR** Not reported.
- RPD** Relative Percent Difference

CASE NARRATIVE

LABORATORY NUMBER	SAMPLE DESCRIPTION	SAMPLE MATRIX	ANALYSES
IKK0238-01	SB-2-S	Soil	6010B-TCLP EPA 1311-Met

- SAMPLE RECEIPT:** Samples were received intact, on ice at 6°C and with chain of custody documentation on 10/31/01. Additional TCLP Lead analysis request was made on 11/6/01.
- HOLDING TIMES:** Holding times were met.
- PRESERVATION:** Samples requiring preservation were verified prior to sample analysis.
- QA/QC CRITERIA:** All analyses met method criteria.
- OBSERVATIONS:** No significant observations were made.
- SUBCONTRACTED:** No analyses were subcontracted to an outside laboratory.

Report Number: ILC0222

Sampled: 03/01/02
Received: 03/06/02

CASE NARRATIVE

LABORATORY NUMBER	SAMPLE DESCRIPTION	SAMPLE MATRIX	ANALYSES
ILC0222-10	SB8-0-0.5	Soil	6010B-STLC EPA 6010B EPA 7471A STLC-Met

SAMPLE RECEIPT: Samples were received intact, on ice at 2°C, and with chain of custody documentation on 3/1/02. Additional analysis request was received on 3/6/02.

HOLDING TIMES: Holding times were met.

PRESERVATION: Samples requiring preservation were verified prior to sample analysis.

QA/QC CRITERIA: All analyses met method criteria except as flagged under the Data Qualifiers column.

OBSERVATIONS: EPA 8270C SVOC results for sample ILC0222-07 (SB4-0-0.5) were reported from a dilution due to suspected matrix interference (dark colored extract). Reporting limits were elevated due to the dilution, so sample results were reported down to the MDLs.

SUBCONTRACTED: No analyses were subcontracted to an outside laboratory.

Sampled: 03/01/02
Received: 03/06/02

DATA QUALIFIERS AND DEFINITIONS

- C** Calibration Verification recovery was above the method control limit for this analyte. Analyte not detected, data not impacted.
- M2** The MS and/or MSD were below the acceptance limits due to sample matrix interference. See Blank Spike (LCS).
- R** The RPD exceeded the method control limit due to sample matrix effects. The individual analyte QA/QC recoveries, however, were within acceptance limits.
- R-3** The RPD exceeded the method control limit due to sample matrix effects.
- RL-1** Reporting limit raised due to sample matrix effects.
- RL-3** Reporting limit raised due to high concentrations of non-target analytes.
- ND** Analyte NOT DETECTED at or above the reporting limit or MDL, if MDL is specified.
- NR** Not reported.
- RPD** Relative Percent Difference

ADDITIONAL COMMENTS

For 1,2-Diphenylhydrazine:

The result for 1,2-Diphenylhydrazine is based upon the reading of its breakdown product, Azobenzene.

Comment Number	Cal-Trans Comment	ENVIRON Response
COMMENTS PROVIDED BY STEVE CHAN (Cal-Trans)		
1.	<p>This permit project is not funded by the Department and thus, all excavated soil shall be disposed of off-site. As a result, the total lead upper confidence limit (UCL) should be reported in comparison to the regulatory disposal thresholds as stipulated in the Health and Safety Code 25157.8 and AB 414. A 95-percent UCL is used for relinquishment to contractors or to determine handling and disposal of excess soil</p>	95-percent UCL are now reported.
2.	<p>On Page 7 in the 1st paragraph, a best-fit line is described as having been calculated and forced through the origin. An equation on Figure 3 indicates that the best-fit line is not forced through the origin. The text needs to be revised to reflect the fact that the best line is not forced through the origin.</p>	The calculations were done as described in the text. Figure 3 has been replaced to reflect the calculations performed as described in the text.
3.	<p>A statistical analysis shall be performed in accordance with the EPA SW-846. As noted in the Revised Report, SW-846 suggests a data transformation (i.e., arcsine or square root) to achieve normality when a simple test of comparing the average to the standard deviation fails. It should be indicated in the text whether or not such simple test of comparison has indeed failed according to the EPA SW-846 and, if so, whether an arcsine or a square root data transformation is appropriate according to EPA SW-846. The statistical analysis may not be deviated from the EPA SW-846.</p>	<p>Table 4 has been revised to include the results of the simple test for normality as described in EPA-SW846. Where indicated by the results, the data were transformed using a square root transformation. Summary statistics, UCL, and threshold comparisons are included in Table 4 for transformed data and data that did not require transformation.</p>
ADDITIONAL RECURRING COMMENTS		
1	Boring identification (1 through 10) on Figure 3 should be revised as SB1 through SB10.	Figure 3 was revised to reflect boring identifications consistent with the text (SB1 through SB10).
2	The two-tailed 90-percent total lead UCL and corresponding soluble lead concentrations should be indicated in the text.	The text was revised to include the 95% one-tail (same as 90% two-tailed) UCLs for square root transformed total lead and square root transformed soluble lead. Additionally, the text includes a comparison of the 95% UCL to the square root transformed regulatory thresholds.

Comment Number	Cal-Trans Comment	ENVIRON Response
3	<p>In a memorandum to the Permits dated December 17, 2001, as part of reviewing an encroachment permit No. 701-6MC-2681, the OEEFS has previously requested sampling and testing of yellow striping to determine its appropriate removal and handling. Based on the review of the current plans dated September 22, 2004, the removal of yellow striping is still proposed, however, the required sampling and testing as well as the recommendations for proper removal and handling have not been received or reviewed by the OEEFS.</p>	<p>According to a memo from ENVIRON to Mr. Steve Chan and Mr. Surya Mantravadi of Cal-Trans dated February 26, 2002, it was ENVIRON's understanding that Cal-Trans had waived the requirement for sampling of the existing yellow pavement markings, and that the material would be managed, contained, sampled, and appropriately disposed at the time of its removal by the contractor. Mr. Chan signed this memo and returned it, signed, to ENVIRON on February 27, 2002.</p>
REVIEW OF ENCROACHMENT PERMIT PROJECT BY STEVE CHAN		
1	<p>Figure 2 is not revised as stated in the Response Letter. A revised Figure 2 should be included as requested in the previous comment letter dated October 15, 2004.</p>	<p>Based on a discussion with Mr. Andrew Yoon of the Department of Transportation (DOT) on January 12, 2005, Figure 2 was revised to correct the sample location names.</p>
2	<p>According to Table 4 in the Revised Report, the statistical analysis resulted in an average total lead concentration of 29.82 mg/kg with a standard deviation of 54.70. A variance for the given set of samples is calculated as the standard deviation squared or 2992.09 indicating that the average, or the mean, is less than the variance. According to the U.S. Environmental Protection Agency SW-846, an arcsin transformation is suggested to achieve normality (see Volume Two, Chapter 9, Sampling Plan) when a mean is less than the variance, or in a negative binomial distribution. In addition, reverse transformation should be performed and 95-percent (one-tailed) upper confidence limits (UCLs) for total lead should be indicated in the text in mg/kg.</p>	<p>Table 4 has been revised and new calculations performed. Based on a conversation with Mr. Andrew Yoon on January 12, 2005, in strict compliance with SW846, and contrary to the October 15 comments, variance was compared to the average to ascertain normality and identify a transformation, if appropriate. Table 4 reflects these calculations. At the suggestion of Mr. Yoon, the 95% UCLs were calculated with the transformed data and then reverse transformed for comparison to the regulatory thresholds.</p> <p>The 95% UCL for total lead (50.5 mg/kg) is included in the text.</p>
3	<p>Statistical Summary in Table 4 does not include correct analytical results for soluble lead. Table 4 indicates that soluble lead was detected in 52 of the samples of a total of 54 samples tested, which contradicts the statement in Section 5.1. In addition, the minimum and maximum concentrations for the soluble lead are not correctly indicated in Table 4. The average value for the set of soluble lead samples presented in Table 4 does not seem to have been correctly presented as a result. It is recommended that the predictable soluble lead be calculated based on the regression analysis (regression equation).</p>	<p>The summary results for soluble lead were revised in Table 4 to include only test results and not estimates based on the regression. At the direction of Mr. Andrew Yoon, the 95% UCL for soluble lead (1.8 mg/l) was calculated by applying the equation [soluble lead = total lead x 0.0357] derived from the regression of soluble lead on total lead to the 95% UCL for total lead (50.5 mg/kg).</p>

Comment Number	Cal-Trans Comment	ENVIRON Response
4	<p>Although roadway excavation is not proposed in the plans, clearing and grubbing will be required, which would involve handling of soils contaminated with aerially deposited lead (ADL). A health and safety plan should be prepared and implemented throughout the construction phase to address the potential health concerns regarding handling of ADL contaminated soil. Should the construction activities result in any excess soil potentially contaminated by ADL, such material shall be properly handled and disposed of off-sites as non-RCRA waste. Handling and disposal of such excess soil shall also be addressed in the construction contract.</p>	<p>It is our understanding, based on a conversation between Steve Chan of the DOT and Barney Michalchuk of Greenberg Farrow that the health and safety plan is not required with this re-submittal and will be prepared and provided to the DOT by the environmental contractor at a later date.</p>
5	<p>Standard special provisions for clearing and grubbing, Health and Safety Plan/Land Compliance Plan and Excavation and Transportation Plan for managing ADL contaminated soils in construction can be provided upon request.</p>	<p>If needed, the environmental contractor will request a copy of these special provisions from the DOT.</p>
<p>COMMENTS PROVIDED BY STEVE CHAN 2-11-05 (Cal-Trans)</p>		
1	<p>Figure 3 previously depicted a best-fit line without forcing it through the origin, which was considered a correct approach. However, in the Revised Report, Figure 3 has been revised to depict best-fit line forced through the origin, resulting in a different regression equation for soluble lead. Figure 3 should be revised without forcing the best-fit line through the origin and a regression equation should be obtained to correctly estimate the concentration of soluble lead at 95-percent upper confident limit (UCL).</p>	<p>Figure 3 has been revised to reflect a best-fit line with a calculated y-intercept. The slope of the line is 0.0437 kg/L with a y-intercept of negative 1.5136 mg/l. Table 4 reflects the change in the best fit line, with a calculated 95% UCL for soluble lead of 0.69 mg/L (0.0437kg/l * 50.5 mg/kg - 1.5136 mg/l). The text has been edited to reflect the change in calculations.</p>
2	<p>On page 2, last paragraph: The UCL, noted in the 1st sentence should be revised to 95%, not 80%.</p>	<p>The text has been edited to reflect 95% UCL.</p>
